1.0 INTRODUCTION

This report presents the results of 2017 sediment chemical characterization, proposed sediment remediation endpoints, and preliminary remediation footprints for sediments in the area known as the Tidal Flats at the Stratford Army Engine Plant (SAEP) in Stratford, Connecticut (the Site). The location of the SAEP is presented in **Figure 1-1**.

This report is an Addendum to the January 2018 Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a). The Final Sediment Remediation Endpoints Report provides the results of 2014 and 2015 sediment chemical characterization, proposes sediment remediation endpoints, and provides preliminary remediation footprints for the areas known as the Tidal Flats and Outfall 008 at the SAEP. Section 4.2 of the Final Sediment Remediation Endpoints Report proposed additional sampling of sediments within the Tidal Flats area to:

- 1) delineate Total PCB concentrations at depths between 4 and 8 feet bgs at selected facility discharge outfalls, and
- 2) delineate more definitively the total PCB concentrations greater than or equal to 50 ppm in the 0-2 foot depth interval.

The following report presents the results of the 2017 investigations and revised preliminary sediment remediation footprints for the area known as the Tidal Flats.

1.1 Background Information

In October 1995, SAEP was placed on the Base Closure and Realignment (BRAC) list, known as BRAC 95. U.S. Army BRAC properties must be investigated to determine the nature and extent of environmental contamination. The U.S. Army prepared a Remedial Investigation (RI) Report (ACSIM, 2004) for the SAEP to characterize the nature and extent of contamination and evaluate potential risk to human health and the environment attributable to the Site.

As presented in the RI Report, under the legal and regulatory framework of the Comprehensive Environmental Resource Conservation and Recovery Act (CERCLA), remedial action and cleanup standards at SAEP will be primarily driven by the CERCLA §120(a)(4) mandate to meet the legally applicable state laws at non-NPL facilities. Under this mandate, two legally applicable state requirements will drive the remedial actions/cleanup standards at the site: (1) the Connecticut Remediation Standards Regulations (RSRs) for soil and groundwater, and (2) the Connecticut Surface Water Standards. Since these criteria are required to be met, regardless of the presence or absence of unacceptable risk, the risk assessment process in this RI Report serves a modified use other than the traditional use of a risk assessment in a RI Report. For those exposure pathways/media covered by the above applicable requirements, the risk assessment will not be decisive of the need for remedial action. Instead, the exceedance of the RSR standards/surface water standards will determine the need for remedial action. For these exposure pathways/media, the human health and ecological risk assessments in the RI Report will be primarily utilized as a basis to develop alternative criteria under the RSRs, when

determined to be pertinent and to clearly demonstrate compliance with the CERCLA protectiveness mandate in the administrative record.

The RI Report states that for exposure pathways/media not covered by the above applicable requirements (i.e., sediment and ecological receptors), the risk assessment will be used in the traditional sense to identify media/exposure pathways that require remedial action to meet the CERCLA protectiveness mandate.

There have been numerous investigations of the sediments in the Tidal Flats and Outfall 008 areas prior to 2014, and are summarized as follows:

- Sampling of the Tidal Flats and Outfall 008 drainage ditch sediments was conducted by the U.S. Army in 1992, 1994, and 1999 as part of a Remedial Investigation.
- The Connecticut Department of Transportation (CTDOT) also conducted sediment investigations in the Outfall 008 drainage ditch in August 2012.
- Background/reference sediment sampling was conducted in 1994, 1999, 2009, and 2012.

The RI Report (ACSIM, 2004) utilized the results of the investigations completed prior to 2002 to develop human health and ecological risk assessments to evaluate risk associated with the sediments of the Tidal Flats and Outfall 008 drainage ditch. The Human-Health Baseline Risk Assessment (HHBRA) considered exposure to sediments for recreational and commercial anglers and shell-fishermen (ACSIM, 2004). The following bullets summarize the HHBRA findings for potential exposure to sediments and consumption of biota:

- Risks associated with potential exposures to chemicals of potential concern (COPCs) in sediment under future recreational use conditions at the Tidal Flats and Outfall 008 drainage ditch are within the USEPA cancer risk range (highest cancer risk = 4E-05).
- The estimated hazard index (HI) value for future recreational use (wading) at the Outfall 008 Drainage ditch does not exceed a value of 1 under the assumption that chromium detected in ditch sediments is present as trivalent chromium (it is likely that the total chromium in the sediments is in the trivalent form because of the anaerobic conditions in this medium).
- Risks associated with hypothetical future commercial angling for fin-fish and commercial shell-fishing are generally within the USEPA cancer risk range and below an HI of 1.
- The results of the HHBRA indicate that ingestion of finfish and oysters at the Tidal Flats exceed an HI of 1 and/or the USEPA cancer risk range, but risks associated with sediment contact, and consumption of other biota (ribbed mussels in the Tidal Flats) are within USEPA risk management criteria.
- Risks associated with consumption of fin-fish and ribbed mussels taken from the Site are less than or equal to risks associated with consumption of fin-fish and ribbed mussels at background locations.

The Baseline Ecological Risk Assessment (BERA) was conducted to characterize ecological risks at the site in accordance with USEPA performance standards for risk characterization (ACSIM, 2004). The following bullets summarize the BERA findings for potential risks to ecological receptors in the Tidal Flats and Outfall 008 drainage ditch:

- The BERA indicates that there is no unacceptable risk to macroinvertebrates in the Tidal Flats.
- There is a potential risk to macroinvertebrates in the Outfall 008 drainage ditch due to inorganics (barium, chromium, and copper) and Aroclor-1260 in sediment. Risks associated with potential exposures to chemicals of potential concern (COPCs).
- The results of the BERA indicate that there is no significant risk to forage fish inhabiting the Tidal Flats; tissue concentrations are comparable to tissue concentrations from reference locations.
- At the Tidal Flats, there is no significant risk to the black duck and great blue heron, but a potential risk to sandpipers due to chromium in sediment and mercury (assumed to be methyl mercury) in biota.
- At Outfall 008, chromium concentrations in sediment may pose a risk to sandpipers, herons, and ducks if they frequently forage at this location (considered unlikely due to poor habitat quality).

Based on the age of the sediment data (1992-1998) associated with the HHBRA and BERA, the CT DEEP requested that, prior to establishment of remedial goals for sediment in the Tidal Flats and Outfall 008 drainage ditch sediments, additional sediment characterization be conducted. In April 2014, the U.S. Department of the Army issued the Final Work Plan for Determination of Sediment Remediation Endpoints, Tidal Flats and Outfall 008, Stratford Army Engine Plant, Stratford, Connecticut (AMEC, 2014a). This work plan was reviewed and approved by the CT DEEP. The Work Plan proposed sediment toxicity testing to assist in developing the remediation endpoint goals for the sediments in question, and laid out the steps for development of the remediation endpoints. The Final Work Plan also presented some of the historical sediment data referenced above. In April and May 2014, additional sediment sampling and toxicity testing were conducted, and in September 2014 the Army issued the Draft Sediment Remediation Endpoints Report for the Tidal Flats and Outfall 008 (AMEC, 2014b). The report presented the results of sediment chemical characterization, toxicity testing results, and proposed sediment remediation endpoints for the Tidal Flats and Outfall 008 areas. The results of the toxicity testing were that toxicity is not definitively linked with a specific chemical present in the sediment. As an alternative to using toxicity test results alone for development of remediation endpoints, the report presented statistical analyses of the data and proposed using an Effects Range Median Quotient (ERM-Q) of 1.0 for the metals cadmium, chromium, and copper.

On December 2, 2014, the CT DEEP submitted comments on the Draft Sediment Remediation Endpoints Report (AMEC, 2014b). CT DEEP concluded from their review of the report that toxicity is not definitively linked with a specific chemical, and recommended setting the remedial goal based on multiple chemicals to more accurately describe the chemical quality associated with the

non-toxic samples. CT DEEP's recommendations for determining the sediment remediation endpoint goals were as follows:

- Use an average ERM-Q of 0.5 for the eight metals arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc; an average ERM-Q > 0.5 would require remediation.
- Concentrations of mercury and PCBs should generally not be present in post-remedial conditions.
- Additional site characterization was needed to refine the area of sediment contamination both at depth within the Tidal Flat and Outfall 008 areas, as well as within surficial and deeper sediments between the eastern edge of the intertidal flats and the Housatonic River.

On February 17, 2015, the U.S. Department of the Army responded to CT DEEP's comments indicating that they agreed to removal of contaminated sediments with average ERM-Qs > 0.5 from the 0-2 foot below ground surface (bgs) interval in both the Tidal Flats and Outfall 008 areas, as well as replacement with CT DEEP-approved backfill.

Following further discussions with CT DEEP, the U.S. Department of the Army issued a memorandum to CT DEEP on March 24, 2015 indicating that they were committed to proceeding with the additional sampling in a timely manner to ensure redevelopment of the SAEP site without further delay.

In April 2015, additional sediment sampling was conducted in the Tidal Flats and Outfall 008 areas, as follows:

- between the Tidal Flats and the margin of the dredged Housatonic River channel,
- at depths greater than 2 feet bgs in the Tidal Flats, and
- at depths greater than 2 feet bgs in the Outfall 008 drainage ditch.

In November 2015, Amec Foster Wheeler was placed under contract to analyze the sediment samples collected in April 2015, and to incorporate the analytical results into a revised version of the Sediment Remediation Endpoints Report. The revised Sediment Remediation Endpoints Report was issued to the Army on July 29, 2016, and to the CT DEEP on March 7, 2017.

On May 17, 2017, the Army received comments from the CT DEEP on the Sediment Remediation Endpoints Report. These comments, and responses from the U.S. Army, are included as Appendix F. As a result of CT DEEP and USEPA comments, the U.S. Army developed a Field Sampling Plan (Amec Foster Wheeler, 2018b) to conduct sediment sampling and analyses in the Tidal Flats to further delineate:

- concentrations of PCBs from 0-2 feet below ground surface (bgs) at locations where total PCBs have been detected at concentrations exceeding 50 ppm; and
- concentrations of PCBs and mercury at depths between 4 and 8 feet bgs near the historic wastewater outfalls which discharged to the Tidal Flats west of the Causeway.

The results of these October 2017 sediment investigations are presented in this report.

1.2 Report Content and Purpose

This report is an Addendum to the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a), and presents the sediment data collected in 2017 from the Tidal Flats area, as well as the revised preliminary sediment remedial footprints (by depth interval) for the Tidal Flats. This document is intended to be used in development of the Feasibility Study for removal of the contaminated sediments. Amec Foster Wheeler is currently under contract with the U.S. Army Corps of Engineers – New England District (CENAE) to perform the Feasibility Study.

2.0 SAMPLING, ANALYSIS, AND VALIDATION

As a result of May 17, 2017 CT DEEP comments on the July 2016 version of the Sediment Remediation Endpoints Report, the U.S. Army developed a Field Sampling Plan (Amec Foster Wheeler, 2018b) to conduct sediment sampling and analyses in the Tidal Flats to further delineate:

- concentrations of PCBs from 0-2 feet below ground surface (bgs) at locations where total PCBs have been detected at concentrations exceeding 50 ppm; and
- concentrations of PCBs and mercury at depths between 4 and 8 feet bgs near the historic wastewater outfalls which discharged to the Tidal Flats west of the Causeway.

Figure 2-1 presents the locations of sediment samples collected, and analyses performed on the samples is presented in **Table 2-1**. Field data records for collection of sediment samples are provided in **Appendix A**.

2.1 Sediment Sampling

Sediment sampling activities were conducted in the Tidal Flats in October 2017 in accordance with the Feasibility Study Final Field Sampling Plan, Stratford Army Engine Plant, Stratford, Connecticut (Amec Foster Wheeler, 2018b), and the Final Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2018c), except where otherwise noted. The following paragraphs detail the locations, quantities, and analyses for the program.

Between October 17 and October 21, 2017, sediment samples were collected for chemical analysis from 32 locations, consisting of 90 individual samples (see **Table 2-1**). Additional sediment cores were collected as contingency samples, as specified in the FSP (Amec Foster Wheeler, 2018b), but were not analyzed by the laboratory. Sediment samples were collected using a Piston-Vibracore® rig mounted on a boat and operated by TG&B Marine Services. Coordinates for the sediment core location were collected using a Garmin GPS system with sub-meter accuracy, and are presented in **Table 2-1**. Field data records for collection of sediment samples are provided in **Appendix A**.

Sediment samples collected from the 0-1 and the 1-2 foot bgs depth intervals were analyzed for PCB homologs (method 8270-SIM), and the samples from 4-5, 5-6, 6-7, and 7-8 foot bgs depth intervals were analyzed for PCB homologs (method 8270-SIM, equivalent to method 680 modified) and mercury (method 245.1) (**Table 2-1**). Sediment samples were analyzed by EnviroSystems, Inc. of Hampton, New Hampshire, a CT DEEP-approved analytical laboratory.

The following bullets present changes from the activities proposed in the Field Sampling Plan (Amec Foster Wheeler, 2018b):

- Location SD-PCB-008 was moved approximately 40 feet southwest of the proposed location due to the presence of the Causeway cover system at the proposed location; and

- 0-1 and 1-2 foot samples were not collected from location SD-PCB-206 due to a field oversight.

2.2 Data Validation

The 2017 analytical data were validated following the USEPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use procedures (USEPA, 2009). Quality control (QC) limits established in the QAPP (Amec Foster Wheeler, 2018c) were used during data validation.

In accordance with general data reporting procedures in the Department of Defense (DOD) Quality Systems Manual (QSM) [DOD, 2017], the laboratory reported results using a combination of three detection limits including the limit of quantitation (LOQ), limit of detection (LOD), and the method detection limit (MDL). Results for compounds that are not detected in samples are reported as U qualified results at the LOD. The laboratory reports positive detections above the MDL. Values between the MDL and the LOQ are qualified as estimated (J) by the laboratory. The Data Validation Report is presented as **Appendix C**.

Analytical data are considered to be usable as reported by the laboratory, except for validation actions for PCB results as reported in **Appendix C**. Validation actions for PCBs include:

- A laboratory control sample had a percent recovery less than the quality control (QC) limit, resulting in monochlorobiphenyl and total PCB, resulting in one sample result being qualified as estimated (J);
- Matrix spike/matrix spike duplicate results for several samples had recoveries outside of QC limits for monochlorobiphenyl, trichlorobiphenyl, tetrachlorobiphenyl, hexachlorobiphenyl, and total PCBs, resulting in several sample results being qualified as estimated (J), and the non-detect result for monochlorobiphenyl rejected (R); and
- Field duplicate results for several samples had relative percent differences exceeding QC limits resulting in several sample results being qualified as estimated (J).

Mercury results are usable without qualification as reported by the laboratory.

3.0 2017 SEDIMENT ANALYTICAL RESULTS

The following subsections present a summary of sediment analytical results for the 2017 sediment samples collected from the Tidal Flats. Locations of sediment samples are presented in **Figure 2-1**. Sediment sample analytical results are presented in **Table 3-1**. Complete analytical results for sediments collected during the 2017 field program are presented in **Appendix C**. For sediment analytical results from prior investigations, please consult the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a).

The following subsections present the 2017 analytical results for total PCBs and mercury in the Tidal Flats sediments by depth interval.

3.1 Total PCBs

For the 0-1 foot bgs interval of the Tidal Flats sediments, total PCBs exceed 1.0 ppm in numerous samples where PCBs > 50 ppm were historically detected, however, no PCB concentrations > 50 ppm were detected, effectively delineating the areas of > 50 ppm total PCBs for this depth interval (**Figure 3-1**).

Total PCBs in the 1-2 foot bgs interval are all < 1.0 ppm, with one exception of a detection at 4.6 ppm near the tip of the Causeway (**Figure 3-2**). No PCB concentrations > 50 ppm were detected in 2017 samples, effectively delineating the areas of > 50 ppm total PCBs for this depth interval.

In accordance with the FSP (Amec Foster Wheeler, 2018b), no samples for PCB analysis were collected in 2017 from the depth intervals 2-3 foot bgs and 3-4 foot bgs (see **Table 2-1**).

Total PCBs detected in the 3-4, 4-5, 5-6, and 7-8 foot bgs intervals were all < 0.0055 ppm (**Figures 3-3 through 3-6**, respectively).

3.2 Total Mercury

In accordance with the FSP (Amec Foster Wheeler, 2018b), no samples for mercury analysis were collected in 2017 from the 0-1, 1-2, 2-3, and 3-4 foot bgs depth intervals (see **Table 2-1**).

Total mercury detected in the 4-5 foot bgs depth interval indicates concentrations < 0.025 ppm in the vicinity of the former wastewater outfalls along the Dike (**Figure 3-7**).

Analysis of total mercury in the 5-6 foot bgs depth interval samples, indicates detections at concentrations <= 0.02 ppm (**Figure 3-8**).

Total mercury detected in the 6-7 foot bgs depth interval indicates concentrations < 0.025 ppm near the former wastewater outfalls along the Dike (**Figure 3-9**).

Analysis of total mercury in the 7-8 foot bgs depth interval samples, indicates detections at concentrations < 0.025 ppm (**Figure 3-8**).

Addendum - Final Sediment Remediation Endpoints Report
Tidal Flats and Outfall 008
Stratford Army Engine Plant, Stratford, Connecticut

In summary, all mercury concentrations for 2017 samples collected from the depth intervals between 4 and 8 feet bgs were at least an order of magnitude less than the ER-M value of 0.71 ppm, and less than the proposed background concentration of 0.55 ppm (Amec Foster Wheeler, 2018b).

4.0 PROPOSED TIDAL FLATS SEDIMENT REMEDIATION FOOTPRINT

The following section presents proposed remedial footprints and estimated volumes of sediment to be removed from the Tidal Flats area based on the data presented in the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a), and the 2017 sample analytical results presented in this report. The proposed remedial footprints and volumes for the Outfall 008 drainage area remain unchanged from those presented in Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a).

To determine the remedial footprint for the Tidal Flats area, average ERM-Q values for eight metals were plotted by depth interval (Amec Foster Wheeler, 2018a). Sediments with average ERM-Q values greater than or equal to 0.5 were considered to require remediation. For each depth interval, interpolated areas of sediments with average ERM-Q values greater than or equal to 0.5 were drawn. Figures 4-1 through 4-6 of the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a) present the sediment average ERM-Q values and an interpolated remedial footprint for the depth intervals 0-1, 1-2, 2-3, 3-4, 5-6, and 7-8 feet bgs, respectively.

As indicated previously in this report, the objectives of the 2017 sediment analytical sampling in the tidal Flats were to delineate: 1) concentrations of PCBs from 0-2 feet bgs at locations where total PCBs have been detected at concentrations exceeding 50 ppm, and 2) concentrations of PCBs and mercury at depths between 4 and 8 feet bgs near the historic wastewater outfalls which discharged to the Tidal Flats west of the Causeway. The following paragraphs describe the impact of 2017 analytical results on the proposed remedial footprints of the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a), and present revised remedial footprints and sediment removal volumes, as necessary.

Total PCB (both Aroclors and Homologs) data from 1992 through 2017 are plotted by depth interval on **Figures 4-1** through **4-8** of this report to evaluate total PCB concentrations relative to the average ERM-Q based remedial footprint presented in the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a). In addition, the interpolated areas of PCBs between 1 and 50 ppm, and > 50 ppm are presented on the figures. The following bullets present a summary by depth interval of the evaluation of total PCB concentrations relative to the average ERM-Q based remedial footprints:

- **0-1 foot bgs (Figure 4-1):** Although the interpolated areas of PCBs between 1 and 50 ppm and > 50 ppm were reduced based on the 2017 data, the 2017 data did not impact the average ERM-Q remedial footprint, as all total PCB concentrations > 0.5 ppm remain within the average ERM-Q remedial footprint. The sample at grid location L6 with a total PCB concentration of 0.45 ppm was not included in the remedial footprint, due to the location being in the river channel where additional sources of PCBs not associated with SAEP may be present. CT DEEP response to comments on the Final Sediment Remediation Endpoints Report (Appendix F, Amec Foster Wheeler, 2018a) anticipate post-remedial conditions based on the 1992-2015 PCBs data to yield an acceptable 95% UCL of 0.13 ppm total PCBs.

- **1-2 feet bgs (Figure 4-2):** Although the interpolated areas of PCBs between 1 and 50 ppm, and > 50 ppm, were reduced based on the 2017 data, the 2017 data did not impact the average ERM-Q remedial footprint, as all total PCB concentrations > 0.2 ppm remain within the average ERM-Q remedial footprint. The exception is for sample SD15TFG601FS at grid location G6 with a total PCB concentration of 0.26 ppm. Based on CT DEEP anticipated post-remedial conditions for the 0-1 foot depth interval (see above), which has very similar post-remedial total PCB concentrations to the 1-2 foot interval, resulting in an acceptable 95% UCL of 0.13 ppm total PCBs, the Army proposes no remedial action at this location.
- **2-3 feet bgs (Figure 4-3):** Samples with total PCB concentrations > 0.2 ppm fall within the average ERM-Q remedial footprint. The exception is sample SD15TFG602FS at grid location G6 with a total PCB concentration of 0.53 ppm. Based on the same rationale provided for this location in the 1-2 foot depth interval (anticipated post-remedial total PCB 95% UCL concentration of 0.13 ppm), the Army proposes no remedial action at this location.
- **3-4 feet bgs (Figure 4-4):** Samples with total PCB concentrations > 0.2 ppm generally fall within the average ERM-Q remedial footprint. The exception is sample SD15TFD003FS at grid location D0 with a total PCB concentration of 0.77 ppm. CT DEEP response to comments on the Final Sediment Remediation Endpoints Report (Appendix F, Amec Foster Wheeler, 2018a) anticipate post-remedial conditions based on the 1992-2015 PCBs data to yield an acceptable 95% UCL of 0.13 ppm total PCBs; therefore, the Army proposes no remedial action at this location.
- **4-5 feet bgs (Figure 4-5):** Total PCB concentrations within this depth interval are < 0.055 ppm, which is less than the proposed background concentration of 0.31 ppm and the ERM value of 0.18 ppm. No remedial action is planned for this depth interval based on average ERM-Q results or total PCB concentrations.
- **5-6 feet bgs (Figure 4-6):** Total PCB concentrations within this depth interval are < 0.055 ppm, which is less than the proposed background concentration of 0.31 ppm and the ERM value of 0.18 ppm. No remedial action is planned for this depth interval based on average ERM-Q results or total PCB concentrations.
- **6-7 feet bgs (Figure 4-7):** Total PCB concentrations in this depth interval are < 0.0015 ppm, which is less than the proposed background concentration of 0.31 ppm and the ERM value of 0.18 ppm. No remedial action is planned for this depth interval based on average ERM-Q results or total PCB concentrations.
- **7-8 feet bgs (Figure 4-8):** 2017 sampling for total PCBs in this depth interval was prompted by detection of total PCBs in sample SD15TFD007FS, at grid location D0, at a concentration of 3.32 ppm. 2017 sampling near this 2015 sample indicates total PCB concentrations within a radius of approximately 50 feet to be < 0.03 ppm. Given the 2017 sampling results are < 0.03 ppm, combined with the fact that the 4-5, 5-6, and 6-7 foot sample intervals above have total PCB concentrations < 0.055 ppm, it is probable that the 2015 sample result of 3.32 ppm is an artifact of sampling procedure, and likely reflects

some form of cross-contamination from the 0-2 foot depth interval at this location. Therefore, no remedial action is planned for this depth interval.

Total mercury data from 1992 through 2017 are plotted by depth interval on **Figures 4-9 through 4-12** of this report to evaluate mercury concentrations relative to the average ERM-Q based remedial footprint presented in the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a). The following bullets present a summary by depth interval of the evaluation of mercury concentrations relative to the average ERM-Q based remedial footprints:

- **0-1 foot bgs (Figure 4-9):** Samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint. The highest mercury concentration in samples outside the proposed remedial footprint is 0.38 ppm, between the tip of the Causeway and the Housatonic River channel.
- **1-2 foot bgs (Figure 4-10):** Samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint.
- **2-3 foot bgs (Figure 4-11):** Samples with total mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint.
- **3-4 foot bgs (Figure 4-12):** Samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint.
- **4-5 foot bgs (Figure 4-13):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.
- **5-6 foot bgs (Figure 4-14):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.
- **6-7 foot bgs (Figure 4-15):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.
- **7-8 foot bgs (Figure 4-16):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.

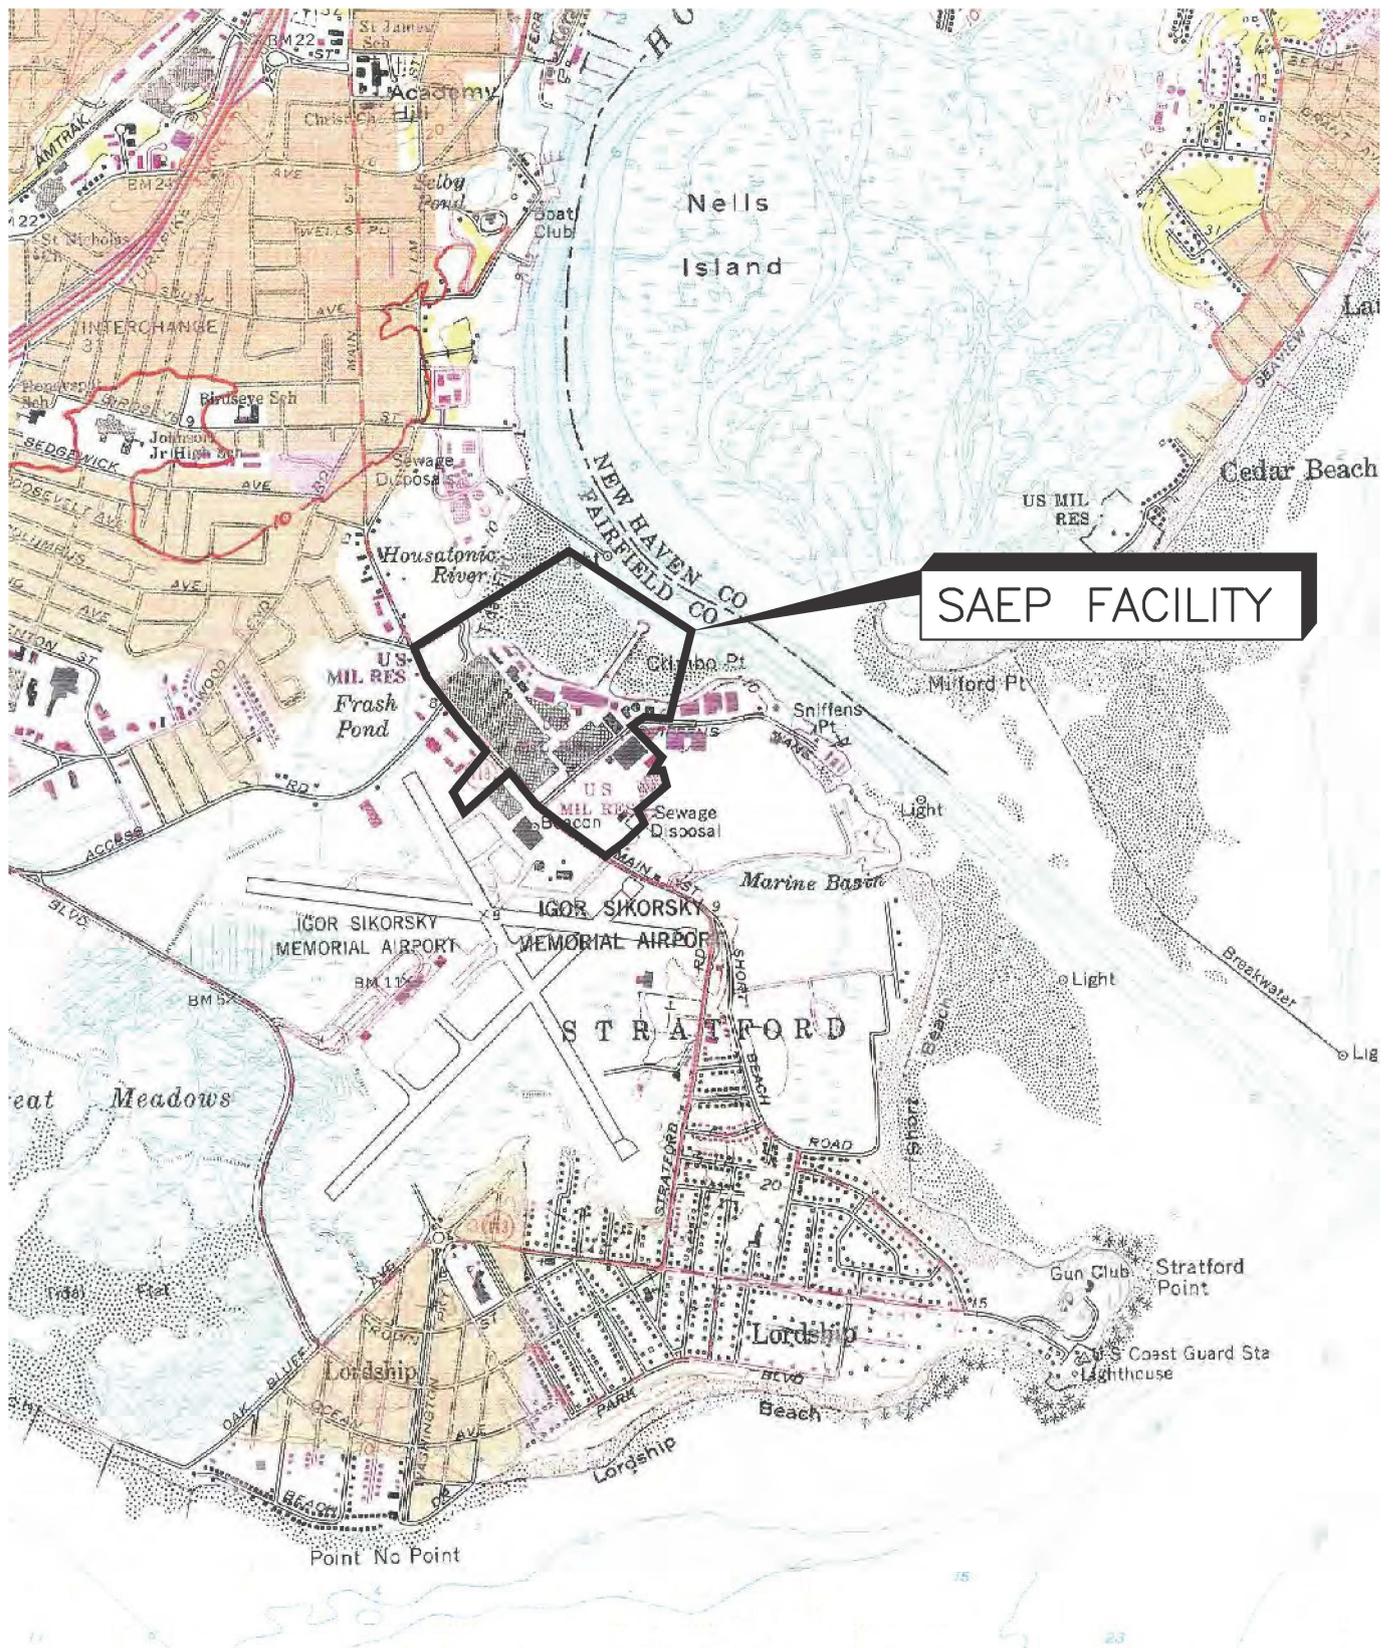

Figure 4-17 presents the proposed remedial footprint for Tidal Flats Area sediments over the depth interval from 0-4 ft bgs, based on average ERM-Q values ≥ 0.5 , and the rationale for inclusion or exclusion of total PCB and mercury results discussed above. **Table 4-1** presents a summary of the estimated volume of sediments, by depth interval from 0-4 feet bgs, proposed for removal from the Tidal Flats Area, as well as estimates of total PCB sediment volumes with concentrations between 1 and 50 ppm, and > 50 ppm.

Note:

- 1) Coordinates are North American Datum 1983 Connecticut State Plane
- 2) 18 Contingency cores will be completed in the same manner as the first 23 cores from 0-2'; however samples will be held frozen at the laboratory pending analytical results from the first 23 cores.

PO Number: None
Report Number: 29853
Date Received: 10/20/17
Date Reported: 01/26/18

Project: Stratford Army Engine Plant

Attached please find results for analyses performed on samples received on 10/20/17 at 0900, 10/23/17 at 0900, and 10/24/17 at 0900.

Samples were received in acceptable condition and under chain of custody.

Instruments used in analysis were calibrated with the appropriate frequency and to the specifications of the referenced methods.

Analytes in blanks were below levels affecting sample results.

Matrix effects as monitored by matrix spike recovery or unusual physical properties were not apparent, except where noted.

Accuracy and precision as monitored by laboratory control sample analyses were within acceptance limits.

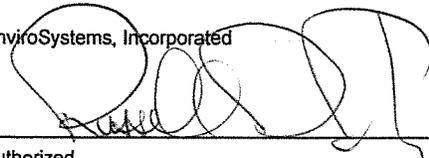

Homologs were analyzed by high resolution gas chromatography/ low resolution mass spectrometry (HRGC/LRMS) methodology. For quantitation, the instrumentation was calibrated using an early- eluting and late- eluting congener associated with each specific homolog except for the single congener, decachlorobiphenyl. The average response for the two congeners was used for quantitation of each specific homolog. In sample extracts congeners were summed to give a total homolog value. Reported homolog values are the sum of the congener peaks detected.

Please visit our website at www.envirosystems.com for a copy of our NH NELAP Accreditation and Massachusetts State Certification.

The results presented in this report relate only to the samples described on the chain(s) of custody and sample receipt log(s), and are intended to be used only by the submittor.

The results for grain size, specific gravity, bulk and dry density, and Atterburg limits were provided by GeoTesting Express of Acton, Massachusetts and have been provided as an appendix to this report.

SAMPLE RECEIPT AND CONDITION DOCUMENTATION

STUDY NO: 29853
 SDG No: AMEC Foster Wheeler
 Project: SAEP Tidal Flats FS, Stratford, CT
 Delivered via: FedEX
 Date and Time Received: 10/20/17 0830 Date and Time Logged into Lab: 10/24/17 1518
 Received By: AM Logged into Lab by: AM
 Air bill / Way bill: No Air bill included in folder if received? NA
 Cooler on ice/packs: Yes Custody Seals present? NA
 Cooler Blank Temp (C) at arrival: 2 Custody Seals intact? NA
 Number of COC Pages: 16
 COC Serial Number(s): 4552
 COC Complete: Yes Does the info on the COC match the samples? Yes
 Sampled Date: Yes Were samples received within holding time? Yes
 Field ID complete: Yes Were all samples properly labeled? Yes
 Sampled Time: Yes Were proper sample containers used? Yes
 Analysis request: Yes Were samples received intact? (none broken or leaking) Yes
 COC Signed and dated: Yes Were sample volumes sufficient for requested analysis? Yes
 Were all samples received? Yes Were VOC vials free of headspace? NA
 Client notification/authorization: Not required pH Test strip ID number: NA

Notes and qualifications:

SAMPLE RECEIPT AND CONDITION DOCUMENTATION

STUDY NO: 29853
 SDG No: AMEC Foster Wheeler
 Project: SAEP Tidal Flats FS, Stratford, CT
 Delivered via: FedEX
 Date and Time Received: 10/20/17 0830 Date and Time Logged into Lab: 10/24/17 1518
 Received By: AM Logged into Lab by: AM
 Air bill / Way bill: No Air bill included in folder if received? NA
 Cooler on ice/packs: Yes Custody Seals present? NA
 Cooler Blank Temp (C) at arrival: 2 Custody Seals intact? NA
 Number of COC Pages: 16
 COC Serial Number(s): 4552
 COC Complete: Yes Does the info on the COC match the samples? Yes
 Sampled Date: Yes Were samples received within holding time? Yes
 Field ID complete: Yes Were all samples properly labeled? Yes
 Sampled Time: Yes Were proper sample containers used? Yes
 Analysis request: Yes Were samples received intact? (none broken or leaking) Yes
 COC Signed and dated: Yes Were sample volumes sufficient for requested analysis? Yes
 Were all samples received? Yes Were VOC vials free of headspace? NA
 Client notification/authorization: Not required pH Test strip ID number: NA

1.0 INTRODUCTION

Sediment samples were collected in the tidal flats at the Stratford Army Engine Plant (SAEP or Site) in Stratford, Connecticut in support of the feasibility study. Samples were collected in October 2017. The samples were analyzed by EnviroSystems in Hampton, New Hampshire. The samples were analyzed by the following U.S. Environmental Protection Agency (USEPA) and American Society for Testing and Materials (ASTM) International methods:

Laboratory	Parameter	Analytical Method	Validation Level
EnviroSystems	PCB Homologs	USEPA 8270 SIM/680 Modified	Stage 2A
EnviroSystems	Mercury	USEPA 245.7	Stage 2A
EnviroSystems	Total Solids	USEPA 160.3	Stage 1

A summary of samples included in this data validation report is presented in Table 1. The analytical data packages were reviewed in accordance with the general specifications for feasibility study (FS) data in the final SAEP Quality Assurance Project Plan (QAPP) [Amec Foster Wheeler Foster Wheeler, 2018].

The data were validated manually by the Amec Foster Wheeler project chemist following the USEPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use procedures (USEPA, 2009). Quality control (QC) limits established in the QAPP were used during data validation. A summary of validated sample results is presented in Table 2. Sediment samples are reported in micrograms per kilograms ($\mu\text{g}/\text{kg}$) and milligrams per kilogram (mg/kg). Elutriate and surface water results are reported in micrograms per liter ($\mu\text{g}/\text{l}$) and milligrams per liter (mg/l). A summary of data validation actions is presented in Table 3. Table 3 includes results for samples that have been qualified (data validation has resulted in revisions to the laboratory result) and any results with validation codes that have been applied by the project chemist. Table 3 includes final results and validation qualifiers and validation reason codes that define the actions.

In accordance with general data reporting procedures in the Department of Defense (DOD) Quality Systems Manual (QSM) [DOD, 2017], the laboratory reported results using a combination of three detection limits including the limit of quantitation (LOQ), limit of detection (LOD), and the method detection limit (MDL). Results for compounds that are not detected in samples are reported as U qualified results at the LOD. The laboratory reports positive detections above the MDL. Values between the MDL and the LOQ are qualified as estimated (J) by the laboratory.

2.0 PCB HOMOLOGs

Samples were analyzed for PCB Homologs by modified USEPA Method 8270 Selected Ion Monitoring (SIM)/680 Modified. A description of validation actions are presented in the following subsection. Data were evaluated based on the following parameters:

- * Data Completeness
 - * Holding Times and Preservation
 - * Blanks
 - Laboratory Control Sample (LCS/LCSD)
 - Matrix Spikes (MS/MSD)
 - Field Duplicate
 - Laboratory Duplicate
 - * Surrogate Recovery
 - * Detection Limits
 - * Sample Result Verification/Electronic Evaluation Verification (EDD)
- * = indicates that criteria were met for this parameter

Except for the validation actions noted below, sample results are interpreted to be usable as reported by the laboratory. A summary of final results is presented on Table 2. A summary of data validation actions is presented on Table 3.

2.1 Laboratory Control Sample

A summary of laboratory control sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of LCS-L.

SDG 29853

In the LCS/LCSD analyzed January 9, 2018, the LCSD percent recovery of monochlorobiphenyl (30) was less than the lower QC limit of 40. The reporting limit for monochlorobiphenyl and the result for total PCB in associated sample SDPCB1060001 was qualified estimated (J/UJ).

2.2 Matrix Spikes

A summary of matrix sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of MS-H and MS-L.

SDG 29853

Sample SDPCB0050001 was submitted for MS/MSD analysis. The MS and/or MSD percent recoveries of monochlorobiphenyl (0 and 0) and trichlorobiphenyl (141) were outside of the QC limits of 40 to 140. The result for monochlorobiphenyl in sample SDPCB0050001 was non-detect and was rejected (R). The result for trichlorobiphenyl and total PCBs in sample SDPCB0050001 were qualified estimated (J).

Sample SDPCB2050001 was submitted for MS/MSD analysis. MS and/or MSD percent recoveries for most of the analytes were zero. With the exception of monochlorobiphenyl, the unspiked sample concentrations were greater than five times the spiking concentration, no action required. The reporting limit for monochlorobiphenyl and the result for total PCBs in sample SDPCB0050001 were qualified estimated (J/UJ).

Sample SDPCB1060001 was submitted for MS/MSD analysis. The MS and/or MSD percent recoveries of monochlorobiphenyl (20), tetrachlorobiphenyl (37), hexachlorobiphenyl (167 and 167), and total PCBs (37) were outside of the QC limits of 40 to 140. The reporting limit for monochlorobiphenyl and the result for tetrachlorobiphenyl, hexachlorobiphenyl, and total PCBs in sample SDPCB1060001 were qualified estimated (J/UJ).

2.3 Field Duplicate

A summary of field duplicate sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of FD.

SDG 29853

Sample SDPCB0040102 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (64), tetrachlorobiphenyl (59), and trichlorobiphenyl (59) exceeded the QC limit of 50. The result for dichlorobiphenyl, tetrachlorobiphenyl, trichlorobiphenyl, and total PCBs in associated samples SDPCB0040102 and SDPCB0040102DP was qualified estimated (J).

Sample SDPCB0060102 was submitted for duplicate analysis. The duplicate RPD of heptachlorobiphenyl (60) and octachlorobiphenyl (62) exceeded the QC limit of 50. The result for heptachlorobiphenyl, octachlorobiphenyl, and total PCBs in associated samples SDPCB0060102 and SDPCB0060102DP was qualified estimated (J).

Sample SDPCB0070001 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (64), heptachlorobiphenyl (87), nonachlorobiphenyl (68), octachlorobiphenyl (55), total PCBs (77), pentachlorobiphenyl (88), tetrachlorobiphenyl (73), and trichlorobiphenyl (87) exceeded the QC limit of 50. The result for dichlorobiphenyl, heptachlorobiphenyl, nonachlorobiphenyl, octachlorobiphenyl, total PCBs, pentachlorobiphenyl, tetrachlorobiphenyl, and trichlorobiphenyl in associated samples SDPCB0070001 and SDPCB0070001DP was qualified estimated (J).

Sample SDPCB1020102 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (57) and tetrachlorobiphenyl (54) exceeded the QC limit of 50. The result for dichlorobiphenyl, and tetrachlorobiphenyl in associated samples SDPCB1020102 and SDPCB1020102DP was qualified estimated (J).

Sample SDPCB1080001 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (68) exceeded the QC limit of 50. The result for dichlorobiphenyl in associated samples SDPCB1080001 and SDPCB1080001DP was qualified estimated (J).

Sample SDPCB3000405 was submitted for duplicate analysis. The duplicate RPD of total PCBs (113), pentachlorobiphenyl (123), tetrachlorobiphenyl (100), and trichlorobiphenyl (117) exceeded the QC limit of 50. The result for total PCBs, pentachlorobiphenyl, tetrachlorobiphenyl, and trichlorobiphenyl in associated samples SDPCB3000405 and SDPCB3000405DP was qualified estimated (J).

Sample SDPCB3030405 was submitted for duplicate analysis. The duplicate RPD of total PCBs (155), pentachlorobiphenyl (146), and tetrachlorobiphenyl (143) exceeded the QC limit of 50. The result for total PCBs, pentachlorobiphenyl, and tetrachlorobiphenyl in associated samples SDPCB3030405 and SDPCB3030405DP was qualified estimated (J).

Sample SDPCB3040405 was submitted for duplicate analysis. The duplicate RPD of heptachlorobiphenyl (123), nonachlorobiphenyl (72), and total PCBs (186) exceeded the QC limit of 50. The result and reporting limits for heptachlorobiphenyl, nonachlorobiphenyl and total PCBs in associated samples SDPCB3040405 and SDPCB3040405 were qualified estimated (J/UJ).

2.4 Laboratory Duplicate

A summary of laboratory duplicate sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of LD.

SDG 29853

Sample SDPCB3040506 was selected by the laboratory for duplicate analysis. The RPD between the sample and duplicate analysis for tetrachlorobiphenyl (34) exceeded the laboratory QC limit of 30. The result for tetrachlorobiphenyl in sample SDPCB3040506 was qualified estimated (J).

3.0 MERCURY

Samples were analyzed for mercury by USEPA Method 245.7. A description of validation actions are presented in the following subsection. Data were evaluated based on the following parameters:

- * Data Completeness
 - * Holding Times and Preservation
 - * Blanks
 - * Laboratory Control Sample (LCS)
 - * Matrix Spikes (MS/MSD)
 - * Field Duplicate
 - * Laboratory Duplicate
 - * Detection Limits
 - * Sample Result Verification/Electronic Evaluation Verification (EDD)
- * = indicates that criteria were met for this parameter

Results are usable as reported by the laboratory. A summary of final results is presented on Table 2.

Notes:

- UG/L = microgram per liter
 - UG/G = microgram per gram
 - UG/KG = microgram per kilogram
 - U = not detected above the reported concentration
 - UJ = not detected above the reported concentration and is estimated
- J = value
R = result

Units:

UG/KG = microgram per kilogram

Validation Reason Codes:

LCS-L = LCS recovery low
 FD = Field duplicate limit exceeded
 LD = Laboratory duplicate limit exceeded
 MS-H = Matrix spike recovery high
 MS-L = Matrix spike recovery low

Validation Qualifier:

U = not detected above the reported concentration
 UJ = not detected above the reported concentration and is estimated
 J = value is estimated
 R = result is rejected

DRAFT FINAL Focused Feasibility Study

APPENDIX A-3

Potential Pre-Design Sediment Investigations

**Potential Pre-Design Sediment Investigations
Stratford Army Engine Plant Focused Feasibility Study**

As indicated in the FFS, the investigations conducted in the Tidal Flats have adequately characterized the contamination in sediments exceeding PRGs and requiring remediation. However, there remains the possibility of residual contamination exceeding background concentrations at depths greater than 4 feet bgs in the Tidal Flats from historic activities at SAEP, as well as former industrial processes along Housatonic River. Future exposure to the potential presence of detectable contamination at depths below 4 feet is not anticipated; however, the Army proposes some limited pre-design sediment characterization in those areas where ERM-Q > 0.5 in the 3-4 foot, bgs interval to evaluate those areas to a depth of 6 feet bgs.

Figure A.3-1 presents the seven areas of the proposed 3-4 ft, bgs excavation interval, as well as the ERM-Q values for samples collected in the 3-4 ft, bgs depth interval. Each of the seven areas presented on Figure A.3-1 have concentrations of contaminants of potential concern exceeding preliminary remedial goals (PRGs). The ERM-Q values (and/or mercury and PCB concentrations) exceed the remedial goal of 0.5 in six of the seven excavation areas (B-1, B-7, E-7, H-1, H-5, L-3), and mercury exceeds the remedial goal of 0.4 ppm in excavation area E-0. Table A.3-1 presents the maximum detected concentration of potential contaminants of concern for each of the seven areas for the depth intervals 3-4, 4-5, and 5-6 feet bgs. Red highlighting of values in the table indicates that a value/concentration exceeds its' respective PRG. Yellow highlighting indicates a potential data gap for that excavation area, depth interval, and analyte.

As shown in Table A.3-1, there is analytical data for the 4-5 and/or 5-6 ft bgs intervals in excavation areas B-1, E-0, and H-1. The potential driver for additional sediment data collection at excavation E-0 is a mercury concentration of 1.9 ppm in the 3-4 ft, bgs depth interval, but maximum concentrations of mercury less than the PRG of 0.4 ppm in 4-5 and 5-6 ft, bgs samples from the E-0 area preclude the need for any additional investigations (Table A.3-1). The remaining six excavation areas are lacking vertical delineation of potential contaminants, and the proposed depth intervals and analytes for additional sampling are presented in Table A.3-1 with yellow highlighting. Figure A.3-1 presents potential locations for sediment core collection to delineate potential metals (ERM-Qs), total PCBs and mercury for the 4-5 and 5-6 ft, bgs depth intervals beneath excavation areas B-1, B-7, E-7, H-1, H-5, and L-3. No investigations of sediment at depths greater than 6 feet, bgs will be conducted by the Army.

The proposed investigations will be conducted prior to the completion of the Design. The Design will specify any additional excavation required as a result of additional contamination detected above PRGs in the 4-6 ft, bgs depth interval. The Army will not conduct any sediment excavation to depths greater than 6 feet, bgs in the Tidal Flats.

TABLE A.3-1

DRAFT FINAL Focused Feasibility Study

APPENDIX A-4

Evaluation of 2006 through 2015 LiDAR Elevation Data – Tidal Flats

Objectives:

- 1) Evaluate impact of Hurricane Sandy (October 2012) on the elevation of Tidal Flats sediments (i.e., was there any impact to sediment surface, and if so, how much?)
- 2) Evaluate sedimentation rates for the Tidal Flats (as available LiDAR data allow)

LiDAR Data Sets:

LiDAR data sets for selected years spanning 2006 through 2015 for the Stratford, Connecticut area are available from the following websites:

http://cteco.uconn.edu/data/lidar/info_lidar.htm (2006, 2012, 2015)

https://coast.noaa.gov/htdata/lidar1_z/

Wood selected the following LiDAR data sets from the websites for evaluation of Tidal Flats historical sediment elevations:

CT Coast 2006

December 2006

Area 187 sq mi

Acquired By FEMA

Projection CT State Plane NAD83 feet, NAVD88 feet

Coast 2012

November 14 to December 16, 2012

Area 116 sq mi

Acquired By US Army Corps of Engineers

Projection Geographic, NAD83 meters, NAVD88 meters

Note: survey conducted shortly after passage of Hurricane Sandy

2015 USACE NAE Topobathy Lidar DEM: Connecticut

June 5, 2015 through June 13, 2015

Acquired By US Army Corps of Engineers

Projection NAD83 meters, NAVD88, using the GEOID12B grids provided by the National Geodetic Survey

A preliminary review of available LiDAR datasets was performed to evaluate feasibility of performing differential LiDAR analysis for the project site. Publicly available datasets have been acquired by various state and Federal agencies during the time span of 2006-2016. The time range of these data encompass the occurrence of Hurricane Sandy (2012) and therefore may be used to evaluate the topographic geomorphic effects of the 2012 Hurricane Sandy event on the site vicinity. Due to variations in tidal cycles during acquisition of some of these data, there is intrinsic variability in the lateral extent of the tidal flat areas scanned by the LiDAR.

The CT Coast (2006) data set includes mudflat elevation data that was acquired during semi-low tide conditions and includes what appear to be sand-bar depositional features at the end of the Causeway. Subsequent to, and as a result of, Hurricane Sandy, USACE collected the Coast 2012 "Post-Sandy" LiDAR dataset. This data was collected to evaluate effects of Hurricane Sandy on the coastal region; however, flight paths yielded only partial coverage of this study area in Stratford CT. This dataset does provide

APPENDIX A-4

Evaluation of 2006 through 2015 LiDAR Elevation Data – Tidal Flats Stratford Army Engine Plant Focused Feasibility Study

September 21, 2018

sufficient coverage for differential LiDAR analysis and so was used with limitations and the caveat that it only represents a percentage of the Tidal Flats area. In 2015, USACE (NAE) acquired a green-LiDAR topobathymetric scan of the study area. A derivative digital elevation model (DEM) surface of this 2015 dataset (NAE) was used as the base for comparison. It included all areas considered intertidal and has the most consistent returns and ground classifications of the three LiDAR data sets used in this evaluation.

Data Processing:

LiDAR data points within the area of the Tidal Flats were extracted for each of the three data sets referenced above. The point clouds, containing irregularly-space points were compared against elevation values within the 2015 DEM. Comparisons of the data sets to evaluate elevation differences over three time periods were made:

- 2006 - 2012 Elevation Differences (2006 to immediately after Sandy)
- 2012 - 2015 Elevation Differences (immediately following Sandy to 2015)
- 2006 - 2015 Elevation Differences (pre-Sandy to 2015)

Histograms representing the difference in elevations for each of the comparative data sets were generated and are presented in the attached Figures 1 through 3. Note that negative values in the histograms represent an increase in sediment elevation, while positive values represent a decrease in elevation.

Preliminary Observations:

The following table presents a summary of statistics for the three elevation data set comparisons (2006 - 2012 (post-Sandy), 2012 (post-Sandy) - 2015, and 2006 – 2015), with negative values indicating an increase in sediment elevation:

Data Set Comparison	Number of Elevation Measurement Points in Comparison	Largest Single Point Sediment Elevation Increase (feet)	Largest Single Point Sediment Elevation Decrease (feet)	Mean Sediment Elevation Differential (feet)	Estimated Mean Sedimentation Rate (ft/yr)
2006 - 2012 (post-Sandy)	105,631	-1.00	1.00	-0.14	-0.02
2012 (post-Sandy) - 2015	130,831	-2.02	2.40	-0.22	-0.07
2006 - 2015	198,537	-3.87	4.75	-0.39	-0.04

Note: Negative values represent an increase in sediment elevation

2006-2012 (post-Sandy): See attached Figure 1. The histogram presented in Figure 1 indicates that of the >105,000 elevation measuring points that the LiDAR data sets have in common, the majority exhibit an increase in elevation of 0.1 to 0.2 feet (mean = 0.14 feet) over this 6-year period, inclusive of the Hurricane Sandy event. Approximately 17.5% of the measurement points indicate a decrease in sediment elevation, primarily located along the Dike/shoreline east of the Causeway. The mean sedimentation rate for the Tidal Flats area covered in this data comparison is 0.02 ft/yr.

2012 (post-Sandy) - 2015: See attached Figure 2. The histogram presented in Figure 2 indicates that of the >130,000 elevation measuring points that the LiDAR data sets have in common, the majority exhibit an increase in elevation of 0.2 to 0.3 feet (mean = 0.22 feet) over this 3-year period following the Hurricane Sandy event. Only a very small percentage (< 1%) of the measurement points indicate a decrease in sediment elevation, primarily located on the southern side of the breakwater bordering the Housatonic River, as well as along the Dike/shoreline east of the Causeway. The mean sedimentation rate for the Tidal Flats area covered in this data comparison is 0.07 ft/yr.

2006-2015: See attached Figure 3. The histogram presented in Figure 3 indicates that of the >195,000 elevation measuring points that the LiDAR data sets have in common, the majority exhibit an increase in elevation of 0.4 to 0.5 feet over this 9-year period encompassing the Sandy event in October 2012. Only a very small percentage (< 1%) of the measurement points indicate a decrease in sediment elevation. The mean sedimentation rate for the Tidal Flats area covered in this data comparison is 0.04 ft/yr.

Preliminary Conclusions:

- Over the six-year time period between 2006 and 2012, the mean sediment elevation of the Tidal Flats increased by 0.14 feet. Using a non-Sandy influenced estimation of sedimentation rate between 2012 and 2015 of 0.07 ft/yr, and extrapolating over the 2006-2012 period of six years, yields a theoretical sediment accumulation of 0.42 feet. Subtracting the measured mean sediment elevation difference of 0.14 between 2006 and 2012 (post-Sandy) from the theoretical estimate of 0.42 feet, results in an estimated mean elevation difference of 0.28 feet, which could be theorized as the mean decrease in elevation resulting from Hurricane Sandy.
- The three data set comparisons indicate an increase in sediment elevation over their respective time periods, with only a very low percentage (<1%) of the measurement points indicating a decrease in sediment elevation.
- Evaluation of LiDAR data by Wood indicates that between 2006 and 2015, the elevation of the Tidal Flats sediments generally increased, with a mean increase of 0.39 feet over the 9-year period inclusive of Hurricane Sandy. As Hurricane Sandy likely impacted the calculated sedimentation rate estimated for the time periods 2006-2012 (0.02 ft/yr) and 2006-2015 (0.04 ft/yr), the timeframe between 2012 (post-Sandy) and 2015 is expected to reflect the most reasonable average sedimentation rate which is 0.07 ft/yr.
- Using a sedimentation rate of 0.07 ft/yr, it is estimated that it would take roughly 14 years for a 1-foot thickness of new sediment to accumulate on the Tidal Flats. However, this does not take into account that if the Tidal Flats were excavated and backfilled to 1 foot below existing grade, the non-equilibrium condition generated by leaving the last 1-foot unfilled would likely increase the rate of sedimentation. Increases in sedimentation rates have been documented at other sediment excavation sites where excavations have not been completely backfilled to grade (<http://www.nae.usace.army.mil/Portals/74/docs/DAMOS/TechReports/186.pdf>).
