ASTM D 422 - 63 STANDARD TEST METHOD FOR PARTICLE SIZE ANALYSIS OF SOIL (HYDROMETER TEST)

Hydrometer Used: 152 H

Soil Weight: 99.55

Zero Correction: 7.0

Dispersing Agent: Sodium Hexametaphosphate

a = 1.000

Meniscus Correction: 0.5

Quantity: 40 gr

ASTM D 422 - 63 STANDARD TEST METHOD FOR PARTICLE SIZE ANALYSIS OF SOIL (HYDROMETER TEST)

Hydrometer Used: 152 H

Soil Weight: 99.44

Zero Correction: 6.5

Dispersing Agent: Sodium Hexametaphosphate

a = 1.010

Meniscus Correction: 0.5

Quantity: 40 gr

120 Research Drive
Stratford, CT 06615

Project: 2010-31-007A01
Date: 06/05/14
Report: 089-14 (HY) 007YRKA, Samp SD14TFD300FS, 050614
Sample: 089-14 (14D1194)
Lab Receipt Date: 05/06/14
Lab Tech: G. Lopez

Project: SD14TFD300FS
Location:

ASTM D 422 - 63 STANDARD TEST METHOD FOR PARTICLE SIZE ANALYSIS OF SOIL (HYDROMETER TEST)

Hydrometer Used: 152 H
Soil Weight: 49.30
Zero Correction: 6.5

Dispersing Agent: Sodium Hexametaphosphate
Quantity: 40 gr
a = 1.010

Meniscus Correction: 0.5

SIEVE ANALYSIS
ASTM DESIGNATION C136
AASHTO DESIGNATION
T 27-881

APPENDIX F

CT DEEP COMMENTS AND ARMY RESPONSES

APPENDIX F-1

CT DEEP MAY 17, 2017 COMMENTS AND ARMY RESPONSES

NOTE: Red text indicates Army responses to CT DEEP requests

May 17, 2017

Ellen Iorio, P.E
US Army Corps of Engineers
New England District
696 Virginia Road
Concord, MA 01742-2751

Dear Ellen:

The Department of Energy and Environmental Protection (DEEP) has reviewed the Sediment Remediation Endpoints Report (the “Report”) and offers the following comments:

In the Report, the extent of the proposed remedial footprint is a rational approximation of known contamination, however additional areas must be included to ensure protection of the environment. The driving factor of the footprint is ERM-Q values greater than 0.5. Some specific locations exceed the reference condition values for PCBs and mercury, or have data documenting sediment acute toxicity although the ERM-Q is less than 0.05. These are also endpoints that should be considered, and DEEP requests modification of the proposed remedial footprint to include some of these locations, as discussed in the following comments, based on the Report, for the Tidal Flats and Outfall 008 areas.

Tidal Flats (TF)

CT DEEP conducted an independent analysis of the available data with the following findings:

- CT DEEP used EPA’s ProUCL and Minitab statistics software on the available data. COC concentrations are highly variable across the tidal flats while most elevated concentrations are observed within the first 0-2 feet of sediment. It was observed that many highly elevated COCs in previous samples are not found in newer data. Statistical comparisons indicate newer data (2014-2016) is different from older data (1990s-2012).
- ERM-Q values above 0.5 would not be removed at one location (TF-L6 at 0.74) because the Army believes it is due to upstream sources. This location is isolated, and in deeper water near the channel. An analysis of the expected post-remedial conditions found the 95% UCL of ERM-Q varied from 0.13-0.31 when calculated by sample depth intervals. A 95% UCL of the remaining ERM-Q values yields a 0.22 for post-remedial conditions based on available data.
- Previously DEEP had calculated the reference condition for total PCBs as 0.2 ppm and a few samples outside of the remedial footprint exceed this value. However the expected post-remedial conditions based on the available data for PCBs concentrations yielded a 95% UCL of 0.13 ppm PCBs.

- Newer sediment samples were not analyzed for mercury throughout the entire surface 4 foot depth interval which limited the analysis for post-remedial conditions. Based on limited data, the expected post-remedial 95%UCL values of mercury concentrations vary with depth from 0.22 -0.52 ppm, although 0.52 ppm was calculated with limited samples in the 1-2ft interval. Combining all mercury concentrations in post-remedial conditions yields a 95%UCL of 0.25 ppm based on the available data.

CT DEEP can concur with the following conclusions in the Sediment Remediation Endpoints Report:

- The site-related constituents as agreed by CT DEEP and Army were analyzed in recent sediment samples. However, mercury was only sampled within 0-0.5 interval for the newer samples which provides limited analysis for all depth intervals.
- The report utilized calculations for the ERM-Q with the 8 specific metals in the sediment samples.
- With the exception of PCBs and mercury, the Tidal Flats had reasonable spatial coverage of most site-related contaminants in sediment samples at one foot intervals up to 4 feet in depth.

CT DEEP requests the following adjustments to the proposed remediation footprint in the Sediment Remediation Endpoints Report:

- The remedial footprint does not include all samples determined to be toxic from survival, growth and reproduction endpoints, which must be included in the remedial action. Specifically include in the remediation footprint the areas of TF-F3 and TF-J3.

While the Army is not in agreement with the interpretation that toxicity test failure is the determining factor for remediation of these areas, the footprint of remediation for the 0-1 foot bgs interval will be expanded to be inclusive of the sampling locations represented by TF-F3 and TF-J3.

- Sample location TF-G6, depending on depth interval, is equal to or exceeds remedial goals for mercury, PCBs and ERM-Q but is not within the remedial footprint. This isolated location is in deeper water closer to the channel but is a likely pour point for the tidal flats during ebbing and low tides, which would receive elevated levels of contamination. DEEP recommends that the Army consider removing this location, especially if it can be incorporated as part of the necessary sediment removal associated with project implementation and equipment access.
- Between 0 and 3 feet bgs at location TF-G6, total PCB concentrations range from 0.15 to 0.53 ppm, and mercury concentrations between 0.35 and 0.58 ppm. PCBs only marginally exceeds background at 2-3 feet. ERM-Q values in this depth interval range from 0.37 to 0.45. Based on this information we would propose that a discrete removal at this location not be proposed based on the limited exceedances and little benefit to the overall risk reduction. Additionally the technical challenges of conducting this discrete removal as the tidal flats deepen into the river channel may be restrictive.

- Sediments near the outfalls (OF-002, -003, -007, and -004) exceed mercury and PCBs remedial goals at various depths. Historic (1994-2008) deeper samples at some of these locations had among the highest PCBs and mercury values reported for the tidal flats. The remedial footprint must include the areas around these outfalls to a sufficient depth to remove potential hotspots and ensure that, even after severe storm disturbance, no pollution will be remobilized to biologically accessible depths. DEEP requests that if deeper pollution will remain its potential to be remobilized be specifically evaluated and demonstrated to be not a concern.

Currently the Army proposes to excavate the areas around outfalls OF-002, -003, -007, and -004 to a total depth of 4 feet. Between 4 and 8 feet bgs, current data indicate there are no ERM-Q values exceeding 0.5 near these outfalls. Between 4 and 8 feet bgs, only one sample (SD2015-TF-D0, 7-8 ft) has a PCB concentration > 0.31 ppm. Mercury concentrations between 4 and 8 ft bgs near the outfalls is < 0.55 ppm. Although the Army believes that the possibility of remobilization of PCBs at depths of 7-8 ft bgs is unlikely, a proposed plan for further characterization of PCBs at these outfalls is proposed:

- Collect sediment cores from 4-8 feet bgs at up to four locations around each of the referenced outfalls (or groups of outfalls), to a radius of approximately 50 feet from the outfall(s);
- Submit samples from each core for the 4-5, 5-6, 6-7, 7-8 ft intervals for analysis of total PCB Aroclors and total PCB Homologs;
- If total PCB concentrations of any sample exceeds 1 ppm, then the sediment within the depth interval out to a radius of 50 feet will be included in the remedy for the tidal flats.

Outfall 008 (OF-008)

CT DEEP conducted an independent analysis of the available data with the following findings:

- CT DEEP used EPA's ProUCL and Minitab statistics software on the available data.
- Most sediment samples exceed the ERM-Q of 0.5 at depths of 0-1, 1-2, and 2-3 feet which in some cases are more than an order of magnitude. Additionally, about half of the samples exceed 0.5 at 3-4 feet in depth.
- The report indicated that all mercury concentrations at the 0-1 foot depth were below detection, but the report did not include a figure for mercury at 1-2 foot depth interval.
- Mercury exceeds the CT DEEP calculated reference condition (0.4ppm) in several samples between 2 to 4 feet deep with one sample at 1.54 ppm of mercury. A 95%UCL of samples at the 2-3ft depth indicate a 0.7 ppm for mercury after the proposed remediation which exceeds the reference condition.
- PCBs concentrations exceeding the reference condition in the 0-2 feet deep horizons would be removed based on the proposed footprint.
- PCB concentrations increase with depth and many samples at 2-3 feet exceed the reference condition and exceed 1 ppm.

- Based on available data the highest concentrations of PCBs would be left with the proposed post-remediation conditions. Many of these PCBs concentrations exceed background by more than an order of magnitude.

CT DEEP can concur with the following conclusions in the Report:

- The site-related constituents as agreed by CT DEEP and Army were analyzed in recent sediment samples.
- The 8 specific metals were utilized in calculations for the ERM-Q with the sediment samples.
- Sediment samples in OF-008 had reasonable spatial coverage of most site-related contaminants at one foot intervals up to 4 feet in depth.

CT DEEP found that there was the following information missing from the Report:

- The report does not include sediment removal volumes for Outfall 008, so CT DEEP cannot comment on the removal volume. Please provide sediment removal volumes proposed.
- The report did not include a figure for mercury at the 1-2 foot depth interval, so CT DEEP cannot complete comments on mercury concentrations that may remain after remediation until that information is provided.

CT DEEP has identified the following issue that requires modification of the Report:

- The report included a remedial footprint that does not extend the full length and consistently to a 2 foot deep within the entire ditch. This proposal contrasts what was previously discussed and proposed to CT DEEP. The Army assumes that samples are no longer representative near the Raymark remedial action, but CT DEEP staff indicated that the Raymark action affected less than half the width of the ditch.
 1. Without additional sampling, the previously acquired samples may be considered adequately representative and the remedial footprint must be revised to consider the remedial goals for ERM-Q (0.5) and the reference condition based goals for PCBs and Mercury,

Or

2. If the Army still desires to re-sample near the Raymark remedial action, any evaluation must a) evaluate PCBs using a comparison threshold of 0.2 ppm, not the proposed 1 ppm, b) analyze for PCBs, mercury and the 8 ERM-Q metals, and 3) re-sample at 1 foot intervals down to 4 feet deep.

As discussed on the May 22, 2017 conference call with CT DEEP, the Army agrees to remediate the entire length of the Outfall 08 drainage ditch (inclusive of the "T" section extending to Route 113 to the southwest and Marine Basin to the northeast) to a depth of 4 feet bgs. New figures will be provided that depict the Raymark waste removal in relation to Outfall 008, and the estimated volumes for removal.

Comments on Investigation and Characterization of the SAEP Tidal Flats described in the Remediation Endpoints Report.

- Raymark waste was fully delineated and removed, including that part extending roughly one third of the way into the tidal channel. It is possible that the channel downstream from sample location OF 12 to the T-juncture is changed compared to current conditions and requires reevaluation. Such reevaluation must be sensitive to possible differences between the side of the channel where the removal occurred and the other side. Because less than half of the channel was affected, the existing environmental data may still be considered conservatively representative.
- The investigation used a Conceptual Site Model (CSM) that incorporates an assumption that sediment concentrations decline with depth. At least locally it appears that the data is inconsistent with this CSM, and these exceptions have generally been noted in the report. These data should ideally be critically reviewed, not just noted as exceptions, to determine if they invalidate the CSM, which was the basis for the sampling design, or identify the reason these locations are considered anomalous.
- A 3D spatial distribution analysis, at least for the ERM-Q data, and possibly for the PCB data, could support the CSM regarding spatial distribution being top down. This would also serve as a justifying foundation for the presumptive linear interpolation used to determine removal boundaries for the ERM-Q based removal. The detailed discussion of spatial distribution based on separately focusing on each individual discrete depth horizon does not adequately incorporate the three-dimensional nature of the contaminant distribution.
- The absence of a full deeper data set is not a critical data gap if the proposed remediation includes placement of clean cover. However, this is not clearly proposed to be included. In the absence of clean cover, there are areas where the deeper data is absent, and a better justification for the reason the data is not needed is necessary as requested for the CSM critical review. Especially, the legacy mercury data is inconsistent with the CSM.
- The report draws the conclusion that elevated contaminant levels at the tip of the causeway and along the breakwater are a contribution from other sources. An alternative hypothesis is that these are the result of remobilization of the SAEP material. This is only not a significant data gap because the Army proposes to remove the contamination in these areas. If removal was not proposed further evaluation of the two alternative hypothesis using fingerprinting, metal ratios, sediment transport modeling or other methodologies would be necessary.
- Specifically, elevated contaminant concentrations at location TF G6 are attributed to off-site sources, yet this is the apparent outflow location for the northern part of the flats and an attribution to sediment transport is equally plausible; DEEP has requested consideration of removal of this location if practical as part of remedial operational implementation.
- The report identifies background levels for PCB and mercury that differ in detail from the DEEP expectation due to a different treatment of outliers in the background data set. Explanation of the rationale for this difference in treatment of outliers in the background determination would assist in understanding the difference in values. The difference in valuations does not appear to substantially impact the development of the remediation footprint for the tidal flats.
- The discussion of PCB and mercury does not focus upon the DEEP requested remedial goal of remediation to achieve conditions “not substantially different from background”, but rather a PCB level of 1 ppm and the mercury ER-M value. Optimally the Report should identify where the ERM-Q removal based on a value of 0.5 will result in leaving behind PCB or mercury exceeding background and justify why additional removal is not necessary to achieve an overall result for these pollutants that is not substantially different from the reference location values. See the above statistical evaluation conducted by DEEP staff, which concludes that the expected post-remediation 95% UCL will generally meet the DEEP requested remedial goal for the tidal flats.

Technical Staff of DEEP's Remediation Division have provided additional comments that identify potential data gaps in the investigation and characterization of the tidal flats. Many of these comments are not significant data gaps if the sediment is removed in accord with the remediation footprint, as modified in response to above comments. In the event a different remedy is implemented, they may need to be addressed. These comments, which are attached, are offered to ensure that the technical limits of the report are mutually understood.

DEEP appreciates your assistance in moving this project forward, and hopes that these comments prove helpful in finalizing a mutually acceptable remedial footprint.

Sincerely,

Patrick F. Bowe
Director
Remediation Division
Bureau of Water Protection and Land Reuse

REVIEW COMMENTS

Project Name: Stratford Army Engine Plant
Location: Stratford, Connecticut
Document Name: (Final) Sediment Remediation Endpoints Report
Prepared By: Amec Foster Wheeler

Date: September 22, 2017
Reviewer: Connecticut DEEP
Dated: August 9, 2017

No.	COMMENTS	USACE Response
1.	The SRER response indicates CENAE’s rational to not include removal of polluted sediment at sample location TF-G6 in the Tidal Flats. DEEP again requests that removal of this be considered, especially if it can be accomplished during any dredging being conducted for access to the project area.	The Army will consider removal of sediment in the vicinity of location TF-G6 during development of the design for remedial action.
2.	The SRER indicates there may be a lack of data pertaining to potential Raymark waste near Outfall 008. DEEP will separately provide a link to characterization data obtained during earlier investigations for the Raymark Superfund Site that may address this data gap adequately.	Comment noted
3.	DEEP is concerned that as project design moves forward with selection of dredging methodology, the selection include consideration of aggressively preventing migration of turbidity downstream beyond the project area, to protect downstream coastal resources. Several years ago DEEP conducted an analysis of dredging options for SAEP and it will be separately provided for your information, since current project managers may not have previously seen it.	Mitigation of turbidity downstream beyond the project area will be evaluated in the design. The Army welcomes any analyses of dredging options the CT DEEP is willing to provide.
4.	DEEP reiterates its earlier opinion that additional lines of evidence would be needed to support the statement in the SRER and FSP that other sources may have caused some of the observed contamination near the breakwater and the tip of the causeway, but since removal is proposed this is not a significant data gap.	Comment noted.
5.	DEEP also reiterates its desire to ensure that the selected backfill material is appropriate, and is placed at sufficient depth to ensure that any remaining contamination is not subject to storm scour.	The Design will propose the selected backfill material and provide some evaluation of potential storm erosion/scour.

1.0 INTRODUCTION

This report presents the results of 2017 sediment chemical characterization, proposed sediment remediation endpoints, and preliminary remediation footprints for sediments in the area known as the Tidal Flats at the Stratford Army Engine Plant (SAEP) in Stratford, Connecticut (the Site). The location of the SAEP is presented in **Figure 1-1**.

This report is an Addendum to the January 2018 Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a). The Final Sediment Remediation Endpoints Report provides the results of 2014 and 2015 sediment chemical characterization, proposes sediment remediation endpoints, and provides preliminary remediation footprints for the areas known as the Tidal Flats and Outfall 008 at the SAEP. Section 4.2 of the Final Sediment Remediation Endpoints Report proposed additional sampling of sediments within the Tidal Flats area to:

- 1) delineate Total PCB concentrations at depths between 4 and 8 feet bgs at selected facility discharge outfalls, and
- 2) delineate more definitively the total PCB concentrations greater than or equal to 50 ppm in the 0-2 foot depth interval.

The following report presents the results of the 2017 investigations and revised preliminary sediment remediation footprints for the area known as the Tidal Flats.

1.1 Background Information

In October 1995, SAEP was placed on the Base Closure and Realignment (BRAC) list, known as BRAC 95. U.S. Army BRAC properties must be investigated to determine the nature and extent of environmental contamination. The U.S. Army prepared a Remedial Investigation (RI) Report (ACSIM, 2004) for the SAEP to characterize the nature and extent of contamination and evaluate potential risk to human health and the environment attributable to the Site.

As presented in the RI Report, under the legal and regulatory framework of the Comprehensive Environmental Resource Conservation and Recovery Act (CERCLA), remedial action and cleanup standards at SAEP will be primarily driven by the CERCLA §120(a)(4) mandate to meet the legally applicable state laws at non-NPL facilities. Under this mandate, two legally applicable state requirements will drive the remedial actions/cleanup standards at the site: (1) the Connecticut Remediation Standards Regulations (RSRs) for soil and groundwater, and (2) the Connecticut Surface Water Standards. Since these criteria are required to be met, regardless of the presence or absence of unacceptable risk, the risk assessment process in this RI Report serves a modified use other than the traditional use of a risk assessment in a RI Report. For those exposure pathways/media covered by the above applicable requirements, the risk assessment will not be decisive of the need for remedial action. Instead, the exceedance of the RSR standards/surface water standards will determine the need for remedial action. For these exposure pathways/media, the human health and ecological risk assessments in the RI Report will be primarily utilized as a basis to develop alternative criteria under the RSRs, when

determined to be pertinent and to clearly demonstrate compliance with the CERCLA protectiveness mandate in the administrative record.

The RI Report states that for exposure pathways/media not covered by the above applicable requirements (i.e., sediment and ecological receptors), the risk assessment will be used in the traditional sense to identify media/exposure pathways that require remedial action to meet the CERCLA protectiveness mandate.

There have been numerous investigations of the sediments in the Tidal Flats and Outfall 008 areas prior to 2014, and are summarized as follows:

- Sampling of the Tidal Flats and Outfall 008 drainage ditch sediments was conducted by the U.S. Army in 1992, 1994, and 1999 as part of a Remedial Investigation.
- The Connecticut Department of Transportation (CTDOT) also conducted sediment investigations in the Outfall 008 drainage ditch in August 2012.
- Background/reference sediment sampling was conducted in 1994, 1999, 2009, and 2012.

The RI Report (ACSIM, 2004) utilized the results of the investigations completed prior to 2002 to develop human health and ecological risk assessments to evaluate risk associated with the sediments of the Tidal Flats and Outfall 008 drainage ditch. The Human-Health Baseline Risk Assessment (HHBRA) considered exposure to sediments for recreational and commercial anglers and shell-fishermen (ACSIM, 2004). The following bullets summarize the HHBRA findings for potential exposure to sediments and consumption of biota:

- Risks associated with potential exposures to chemicals of potential concern (COPCs) in sediment under future recreational use conditions at the Tidal Flats and Outfall 008 drainage ditch are within the USEPA cancer risk range (highest cancer risk = 4E-05).
- The estimated hazard index (HI) value for future recreational use (wading) at the Outfall 008 Drainage ditch does not exceed a value of 1 under the assumption that chromium detected in ditch sediments is present as trivalent chromium (it is likely that the total chromium in the sediments is in the trivalent form because of the anaerobic conditions in this medium).
- Risks associated with hypothetical future commercial angling for fin-fish and commercial shell-fishing are generally within the USEPA cancer risk range and below an HI of 1.
- The results of the HHBRA indicate that ingestion of finfish and oysters at the Tidal Flats exceed an HI of 1 and/or the USEPA cancer risk range, but risks associated with sediment contact, and consumption of other biota (ribbed mussels in the Tidal Flats) are within USEPA risk management criteria.
- Risks associated with consumption of fin-fish and ribbed mussels taken from the Site are less than or equal to risks associated with consumption of fin-fish and ribbed mussels at background locations.

The Baseline Ecological Risk Assessment (BERA) was conducted to characterize ecological risks at the site in accordance with USEPA performance standards for risk characterization (ACSIM, 2004). The following bullets summarize the BERA findings for potential risks to ecological receptors in the Tidal Flats and Outfall 008 drainage ditch:

- The BERA indicates that there is no unacceptable risk to macroinvertebrates in the Tidal Flats.
- There is a potential risk to macroinvertebrates in the Outfall 008 drainage ditch due to inorganics (barium, chromium, and copper) and Aroclor-1260 in sediment. Risks associated with potential exposures to chemicals of potential concern (COPCs).
- The results of the BERA indicate that there is no significant risk to forage fish inhabiting the Tidal Flats; tissue concentrations are comparable to tissue concentrations from reference locations.
- At the Tidal Flats, there is no significant risk to the black duck and great blue heron, but a potential risk to sandpipers due to chromium in sediment and mercury (assumed to be methyl mercury) in biota.
- At Outfall 008, chromium concentrations in sediment may pose a risk to sandpipers, herons, and ducks if they frequently forage at this location (considered unlikely due to poor habitat quality).

Based on the age of the sediment data (1992-1998) associated with the HHBRA and BERA, the CT DEEP requested that, prior to establishment of remedial goals for sediment in the Tidal Flats and Outfall 008 drainage ditch sediments, additional sediment characterization be conducted. In April 2014, the U.S. Department of the Army issued the Final Work Plan for Determination of Sediment Remediation Endpoints, Tidal Flats and Outfall 008, Stratford Army Engine Plant, Stratford, Connecticut (AMEC, 2014a). This work plan was reviewed and approved by the CT DEEP. The Work Plan proposed sediment toxicity testing to assist in developing the remediation endpoint goals for the sediments in question, and laid out the steps for development of the remediation endpoints. The Final Work Plan also presented some of the historical sediment data referenced above. In April and May 2014, additional sediment sampling and toxicity testing were conducted, and in September 2014 the Army issued the Draft Sediment Remediation Endpoints Report for the Tidal Flats and Outfall 008 (AMEC, 2014b). The report presented the results of sediment chemical characterization, toxicity testing results, and proposed sediment remediation endpoints for the Tidal Flats and Outfall 008 areas. The results of the toxicity testing were that toxicity is not definitively linked with a specific chemical present in the sediment. As an alternative to using toxicity test results alone for development of remediation endpoints, the report presented statistical analyses of the data and proposed using an Effects Range Median Quotient (ERM-Q) of 1.0 for the metals cadmium, chromium, and copper.

On December 2, 2014, the CT DEEP submitted comments on the Draft Sediment Remediation Endpoints Report (AMEC, 2014b). CT DEEP concluded from their review of the report that toxicity is not definitively linked with a specific chemical, and recommended setting the remedial goal based on multiple chemicals to more accurately describe the chemical quality associated with the

non-toxic samples. CT DEEP's recommendations for determining the sediment remediation endpoint goals were as follows:

- Use an average ERM-Q of 0.5 for the eight metals arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc; an average ERM-Q > 0.5 would require remediation.
- Concentrations of mercury and PCBs should generally not be present in post-remedial conditions.
- Additional site characterization was needed to refine the area of sediment contamination both at depth within the Tidal Flat and Outfall 008 areas, as well as within surficial and deeper sediments between the eastern edge of the intertidal flats and the Housatonic River.

On February 17, 2015, the U.S. Department of the Army responded to CT DEEP's comments indicating that they agreed to removal of contaminated sediments with average ERM-Qs > 0.5 from the 0-2 foot below ground surface (bgs) interval in both the Tidal Flats and Outfall 008 areas, as well as replacement with CT DEEP-approved backfill.

Following further discussions with CT DEEP, the U.S. Department of the Army issued a memorandum to CT DEEP on March 24, 2015 indicating that they were committed to proceeding with the additional sampling in a timely manner to ensure redevelopment of the SAEP site without further delay.

In April 2015, additional sediment sampling was conducted in the Tidal Flats and Outfall 008 areas, as follows:

- between the Tidal Flats and the margin of the dredged Housatonic River channel,
- at depths greater than 2 feet bgs in the Tidal Flats, and
- at depths greater than 2 feet bgs in the Outfall 008 drainage ditch.

In November 2015, Amec Foster Wheeler was placed under contract to analyze the sediment samples collected in April 2015, and to incorporate the analytical results into a revised version of the Sediment Remediation Endpoints Report. The revised Sediment Remediation Endpoints Report was issued to the Army on July 29, 2016, and to the CT DEEP on March 7, 2017.

On May 17, 2017, the Army received comments from the CT DEEP on the Sediment Remediation Endpoints Report. These comments, and responses from the U.S. Army, are included as Appendix F. As a result of CT DEEP and USEPA comments, the U.S. Army developed a Field Sampling Plan (Amec Foster Wheeler, 2018b) to conduct sediment sampling and analyses in the Tidal Flats to further delineate:

- concentrations of PCBs from 0-2 feet below ground surface (bgs) at locations where total PCBs have been detected at concentrations exceeding 50 ppm; and
- concentrations of PCBs and mercury at depths between 4 and 8 feet bgs near the historic wastewater outfalls which discharged to the Tidal Flats west of the Causeway.

The results of these October 2017 sediment investigations are presented in this report.

1.2 Report Content and Purpose

This report is an Addendum to the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a), and presents the sediment data collected in 2017 from the Tidal Flats area, as well as the revised preliminary sediment remedial footprints (by depth interval) for the Tidal Flats. This document is intended to be used in development of the Feasibility Study for removal of the contaminated sediments. Amec Foster Wheeler is currently under contract with the U.S. Army Corps of Engineers – New England District (CENAE) to perform the Feasibility Study.

2.0 SAMPLING, ANALYSIS, AND VALIDATION

As a result of May 17, 2017 CT DEEP comments on the July 2016 version of the Sediment Remediation Endpoints Report, the U.S. Army developed a Field Sampling Plan (Amec Foster Wheeler, 2018b) to conduct sediment sampling and analyses in the Tidal Flats to further delineate:

- concentrations of PCBs from 0-2 feet below ground surface (bgs) at locations where total PCBs have been detected at concentrations exceeding 50 ppm; and
- concentrations of PCBs and mercury at depths between 4 and 8 feet bgs near the historic wastewater outfalls which discharged to the Tidal Flats west of the Causeway.

Figure 2-1 presents the locations of sediment samples collected, and analyses performed on the samples is presented in **Table 2-1**. Field data records for collection of sediment samples are provided in **Appendix A**.

2.1 Sediment Sampling

Sediment sampling activities were conducted in the Tidal Flats in October 2017 in accordance with the Feasibility Study Final Field Sampling Plan, Stratford Army Engine Plant, Stratford, Connecticut (Amec Foster Wheeler, 2018b), and the Final Quality Assurance Project Plan (QAPP) (Amec Foster Wheeler, 2018c), except where otherwise noted. The following paragraphs detail the locations, quantities, and analyses for the program.

Between October 17 and October 21, 2017, sediment samples were collected for chemical analysis from 32 locations, consisting of 90 individual samples (see **Table 2-1**). Additional sediment cores were collected as contingency samples, as specified in the FSP (Amec Foster Wheeler, 2018b), but were not analyzed by the laboratory. Sediment samples were collected using a Piston-Vibracore® rig mounted on a boat and operated by TG&B Marine Services. Coordinates for the sediment core location were collected using a Garmin GPS system with sub-meter accuracy, and are presented in **Table 2-1**. Field data records for collection of sediment samples are provided in **Appendix A**.

Sediment samples collected from the 0-1 and the 1-2 foot bgs depth intervals were analyzed for PCB homologs (method 8270-SIM), and the samples from 4-5, 5-6, 6-7, and 7-8 foot bgs depth intervals were analyzed for PCB homologs (method 8270-SIM, equivalent to method 680 modified) and mercury (method 245.1) (**Table 2-1**). Sediment samples were analyzed by EnviroSystems, Inc. of Hampton, New Hampshire, a CT DEEP-approved analytical laboratory.

The following bullets present changes from the activities proposed in the Field Sampling Plan (Amec Foster Wheeler, 2018b):

- Location SD-PCB-008 was moved approximately 40 feet southwest of the proposed location due to the presence of the Causeway cover system at the proposed location; and

- 0-1 and 1-2 foot samples were not collected from location SD-PCB-206 due to a field oversight.

2.2 Data Validation

The 2017 analytical data were validated following the USEPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use procedures (USEPA, 2009). Quality control (QC) limits established in the QAPP (Amec Foster Wheeler, 2018c) were used during data validation.

In accordance with general data reporting procedures in the Department of Defense (DOD) Quality Systems Manual (QSM) [DOD, 2017], the laboratory reported results using a combination of three detection limits including the limit of quantitation (LOQ), limit of detection (LOD), and the method detection limit (MDL). Results for compounds that are not detected in samples are reported as U qualified results at the LOD. The laboratory reports positive detections above the MDL. Values between the MDL and the LOQ are qualified as estimated (J) by the laboratory. The Data Validation Report is presented as **Appendix C**.

Analytical data are considered to be usable as reported by the laboratory, except for validation actions for PCB results as reported in **Appendix C**. Validation actions for PCBs include:

- A laboratory control sample had a percent recovery less than the quality control (QC) limit, resulting in monochlorobiphenyl and total PCB, resulting in one sample result being qualified as estimated (J);
- Matrix spike/matrix spike duplicate results for several samples had recoveries outside of QC limits for monochlorobiphenyl, trichlorobiphenyl, tetrachlorobiphenyl, hexachlorobiphenyl, and total PCBs, resulting in several sample results being qualified as estimated (J), and the non-detect result for monochlorobiphenyl rejected (R); and
- Field duplicate results for several samples had relative percent differences exceeding QC limits resulting in several sample results being qualified as estimated (J).

Mercury results are usable without qualification as reported by the laboratory.

3.0 2017 SEDIMENT ANALYTICAL RESULTS

The following subsections present a summary of sediment analytical results for the 2017 sediment samples collected from the Tidal Flats. Locations of sediment samples are presented in **Figure 2-1**. Sediment sample analytical results are presented in **Table 3-1**. Complete analytical results for sediments collected during the 2017 field program are presented in **Appendix C**. For sediment analytical results from prior investigations, please consult the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a).

The following subsections present the 2017 analytical results for total PCBs and mercury in the Tidal Flats sediments by depth interval.

3.1 Total PCBs

For the 0-1 foot bgs interval of the Tidal Flats sediments, total PCBs exceed 1.0 ppm in numerous samples where PCBs > 50 ppm were historically detected, however, no PCB concentrations > 50 ppm were detected, effectively delineating the areas of > 50 ppm total PCBs for this depth interval (**Figure 3-1**).

Total PCBs in the 1-2 foot bgs interval are all < 1.0 ppm, with one exception of a detection at 4.6 ppm near the tip of the Causeway (**Figure 3-2**). No PCB concentrations > 50 ppm were detected in 2017 samples, effectively delineating the areas of > 50 ppm total PCBs for this depth interval.

In accordance with the FSP (Amec Foster Wheeler, 2018b), no samples for PCB analysis were collected in 2017 from the depth intervals 2-3 foot bgs and 3-4 foot bgs (see **Table 2-1**).

Total PCBs detected in the 3-4, 4-5, 5-6, and 7-8 foot bgs intervals were all < 0.0055 ppm (**Figures 3-3 through 3-6**, respectively).

3.2 Total Mercury

In accordance with the FSP (Amec Foster Wheeler, 2018b), no samples for mercury analysis were collected in 2017 from the 0-1, 1-2, 2-3, and 3-4 foot bgs depth intervals (see **Table 2-1**).

Total mercury detected in the 4-5 foot bgs depth interval indicates concentrations < 0.025 ppm in the vicinity of the former wastewater outfalls along the Dike (**Figure 3-7**).

Analysis of total mercury in the 5-6 foot bgs depth interval samples, indicates detections at concentrations <= 0.02 ppm (**Figure 3-8**).

Total mercury detected in the 6-7 foot bgs depth interval indicates concentrations < 0.025 ppm near the former wastewater outfalls along the Dike (**Figure 3-9**).

Analysis of total mercury in the 7-8 foot bgs depth interval samples, indicates detections at concentrations < 0.025 ppm (**Figure 3-8**).

Addendum - Final Sediment Remediation Endpoints Report
Tidal Flats and Outfall 008
Stratford Army Engine Plant, Stratford, Connecticut

In summary, all mercury concentrations for 2017 samples collected from the depth intervals between 4 and 8 feet bgs were at least an order of magnitude less than the ER-M value of 0.71 ppm, and less than the proposed background concentration of 0.55 ppm (Amec Foster Wheeler, 2018b).

4.0 PROPOSED TIDAL FLATS SEDIMENT REMEDIATION FOOTPRINT

The following section presents proposed remedial footprints and estimated volumes of sediment to be removed from the Tidal Flats area based on the data presented in the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a), and the 2017 sample analytical results presented in this report. The proposed remedial footprints and volumes for the Outfall 008 drainage area remain unchanged from those presented in Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a).

To determine the remedial footprint for the Tidal Flats area, average ERM-Q values for eight metals were plotted by depth interval (Amec Foster Wheeler, 2018a). Sediments with average ERM-Q values greater than or equal to 0.5 were considered to require remediation. For each depth interval, interpolated areas of sediments with average ERM-Q values greater than or equal to 0.5 were drawn. Figures 4-1 through 4-6 of the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a) present the sediment average ERM-Q values and an interpolated remedial footprint for the depth intervals 0-1, 1-2, 2-3, 3-4, 5-6, and 7-8 feet bgs, respectively.

As indicated previously in this report, the objectives of the 2017 sediment analytical sampling in the tidal Flats were to delineate: 1) concentrations of PCBs from 0-2 feet bgs at locations where total PCBs have been detected at concentrations exceeding 50 ppm, and 2) concentrations of PCBs and mercury at depths between 4 and 8 feet bgs near the historic wastewater outfalls which discharged to the Tidal Flats west of the Causeway. The following paragraphs describe the impact of 2017 analytical results on the proposed remedial footprints of the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a), and present revised remedial footprints and sediment removal volumes, as necessary.

Total PCB (both Aroclors and Homologs) data from 1992 through 2017 are plotted by depth interval on **Figures 4-1** through **4-8** of this report to evaluate total PCB concentrations relative to the average ERM-Q based remedial footprint presented in the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a). In addition, the interpolated areas of PCBs between 1 and 50 ppm, and > 50 ppm are presented on the figures. The following bullets present a summary by depth interval of the evaluation of total PCB concentrations relative to the average ERM-Q based remedial footprints:

- **0-1 foot bgs (Figure 4-1):** Although the interpolated areas of PCBs between 1 and 50 ppm and > 50 ppm were reduced based on the 2017 data, the 2017 data did not impact the average ERM-Q remedial footprint, as all total PCB concentrations > 0.5 ppm remain within the average ERM-Q remedial footprint. The sample at grid location L6 with a total PCB concentration of 0.45 ppm was not included in the remedial footprint, due to the location being in the river channel where additional sources of PCBs not associated with SAEP may be present. CT DEEP response to comments on the Final Sediment Remediation Endpoints Report (Appendix F, Amec Foster Wheeler, 2018a) anticipate post-remedial conditions based on the 1992-2015 PCBs data to yield an acceptable 95% UCL of 0.13 ppm total PCBs.

- **1-2 feet bgs (Figure 4-2):** Although the interpolated areas of PCBs between 1 and 50 ppm, and > 50 ppm, were reduced based on the 2017 data, the 2017 data did not impact the average ERM-Q remedial footprint, as all total PCB concentrations > 0.2 ppm remain within the average ERM-Q remedial footprint. The exception is for sample SD15TFG601FS at grid location G6 with a total PCB concentration of 0.26 ppm. Based on CT DEEP anticipated post-remedial conditions for the 0-1 foot depth interval (see above), which has very similar post-remedial total PCB concentrations to the 1-2 foot interval, resulting in an acceptable 95% UCL of 0.13 ppm total PCBs, the Army proposes no remedial action at this location.
- **2-3 feet bgs (Figure 4-3):** Samples with total PCB concentrations > 0.2 ppm fall within the average ERM-Q remedial footprint. The exception is sample SD15TFG602FS at grid location G6 with a total PCB concentration of 0.53 ppm. Based on the same rationale provided for this location in the 1-2 foot depth interval (anticipated post-remedial total PCB 95% UCL concentration of 0.13 ppm), the Army proposes no remedial action at this location.
- **3-4 feet bgs (Figure 4-4):** Samples with total PCB concentrations > 0.2 ppm generally fall within the average ERM-Q remedial footprint. The exception is sample SD15TFD003FS at grid location D0 with a total PCB concentration of 0.77 ppm. CT DEEP response to comments on the Final Sediment Remediation Endpoints Report (Appendix F, Amec Foster Wheeler, 2018a) anticipate post-remedial conditions based on the 1992-2015 PCBs data to yield an acceptable 95% UCL of 0.13 ppm total PCBs; therefore, the Army proposes no remedial action at this location.
- **4-5 feet bgs (Figure 4-5):** Total PCB concentrations within this depth interval are < 0.055 ppm, which is less than the proposed background concentration of 0.31 ppm and the ERM value of 0.18 ppm. No remedial action is planned for this depth interval based on average ERM-Q results or total PCB concentrations.
- **5-6 feet bgs (Figure 4-6):** Total PCB concentrations within this depth interval are < 0.055 ppm, which is less than the proposed background concentration of 0.31 ppm and the ERM value of 0.18 ppm. No remedial action is planned for this depth interval based on average ERM-Q results or total PCB concentrations.
- **6-7 feet bgs (Figure 4-7):** Total PCB concentrations in this depth interval are < 0.0015 ppm, which is less than the proposed background concentration of 0.31 ppm and the ERM value of 0.18 ppm. No remedial action is planned for this depth interval based on average ERM-Q results or total PCB concentrations.
- **7-8 feet bgs (Figure 4-8):** 2017 sampling for total PCBs in this depth interval was prompted by detection of total PCBs in sample SD15TFD007FS, at grid location D0, at a concentration of 3.32 ppm. 2017 sampling near this 2015 sample indicates total PCB concentrations within a radius of approximately 50 feet to be < 0.03 ppm. Given the 2017 sampling results are < 0.03 ppm, combined with the fact that the 4-5, 5-6, and 6-7 foot sample intervals above have total PCB concentrations < 0.055 ppm, it is probable that the 2015 sample result of 3.32 ppm is an artifact of sampling procedure, and likely reflects

some form of cross-contamination from the 0-2 foot depth interval at this location. Therefore, no remedial action is planned for this depth interval.

Total mercury data from 1992 through 2017 are plotted by depth interval on **Figures 4-9 through 4-12** of this report to evaluate mercury concentrations relative to the average ERM-Q based remedial footprint presented in the Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018a). The following bullets present a summary by depth interval of the evaluation of mercury concentrations relative to the average ERM-Q based remedial footprints:

- **0-1 foot bgs (Figure 4-9):** Samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint. The highest mercury concentration in samples outside the proposed remedial footprint is 0.38 ppm, between the tip of the Causeway and the Housatonic River channel.
- **1-2 foot bgs (Figure 4-10):** Samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint.
- **2-3 foot bgs (Figure 4-11):** Samples with total mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint.
- **3-4 foot bgs (Figure 4-12):** Samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm fall within the average ERM-Q remedial footprint.
- **4-5 foot bgs (Figure 4-13):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.
- **5-6 foot bgs (Figure 4-14):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.
- **6-7 foot bgs (Figure 4-15):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.
- **7-8 foot bgs (Figure 4-16):** There are no samples with mercury concentrations greater than the proposed background concentration of 0.55 ppm and the ER-M value of 0.71 ppm within this depth interval.

Figure 4-17 presents the proposed remedial footprint for Tidal Flats Area sediments over the depth interval from 0-4 ft bgs, based on average ERM-Q values ≥ 0.5 , and the rationale for inclusion or exclusion of total PCB and mercury results discussed above. **Table 4-1** presents a summary of the estimated volume of sediments, by depth interval from 0-4 feet bgs, proposed for removal from the Tidal Flats Area, as well as estimates of total PCB sediment volumes with concentrations between 1 and 50 ppm, and > 50 ppm.

Notes:

- 1) All concentrations are in parts per million (ppm)
- 2) The background concentration for Mercury of 0.55 ppm was developed by taking the 95%UCL of mercury concentrations from sample locations across the river adjacent to Nells Island. The background value was presented in a presentation to the CT DEEP on March 4, 2013.

Stratford Army Engine Plant - Feasibility Study

SEDIMENT CORE and DISCRETE SAMPLE LOG

Site: Stratford Army Engine Plant	Project No.: 3616176064	Logger: JKT
Sub: TG&B	WO:	Crew: TG+B
Date: 10.17.17	Time: 13:27	Vessel: Coring Carolina

Coordinates: Easting _____ Northing _____ way pt 1174

Sampling Station: SD-PCB-003

Weather/Conditions: 52° sun Traffic: _____ Water Temp: _____

Measured Water Depth (ft): 5.3 ft.	Coring Notes:
Core Liner tube length (ft): 3 ft.	
Core Penetration (ft) 2.2 ft. Core Recovery (ft): 1.9 ft.	
Calculated Percent Recovery: 86%	

Interval	Sample ID	Description (Odor, Color, Type, etc.)	Notes
0-1'	SDPCB003001 10/18/17@ 1335	Moderate odor, 5Y 2.5/1 silty FN sand	0.5' - 0.85' TR shells 5Y 3/1 mottled
1-2'	SDPCB003010 10/18/17@ 1345	Same as above ~1.8' - 1.9' TR clay	
3-4'		End of core at 1.93'	
4-5'			
5-6'			
6-7'			
7-8'			

Number of containers: 1	2-16oz	Equipment	Sampler Type: Vibracore / Push-Core w/ hammer
Type of container: 40 ml VOA	Amber Jar	Capacity: 2-5/8" ID Core Barrels	

Live Organisms present	Y	N	Shell organisms
Oil-Like Present	Y	N	
Odor Present	Y	N	
Debris Present	Y	N

PO Number: None
Report Number: 29853
Date Received: 10/20/17
Date Reported: 01/26/18

Project: Stratford Army Engine Plant

Attached please find results for analyses performed on samples received on 10/20/17 at 0900, 10/23/17 at 0900, and 10/24/17 at 0900.

Samples were received in acceptable condition and under chain of custody.

Instruments used in analysis were calibrated with the appropriate frequency and to the specifications of the referenced methods.

Analytes in blanks were below levels affecting sample results.

Matrix effects as monitored by matrix spike recovery or unusual physical properties were not apparent, except where noted.

Accuracy and precision as monitored by laboratory control sample analyses were within acceptance limits.

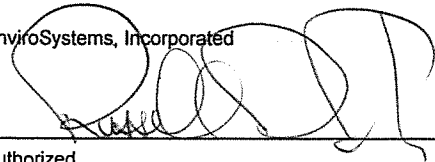

Homologs were analyzed by high resolution gas chromatography/ low resolution mass spectrometry (HRGC/LRMS) methodology. For quantitation, the instrumentation was calibrated using an early- eluting and late- eluting congener associated with each specific homolog except for the single congener, decachlorobiphenyl. The average response for the two congeners was used for quantitation of each specific homolog. In sample extracts congeners were summed to give a total homolog value. Reported homolog values are the sum of the congener peaks detected.

Please visit our website at www.envirosystems.com for a copy of our NH NELAP Accreditation and Massachusetts State Certification.

The results presented in this report relate only to the samples described on the chain(s) of custody and sample receipt log(s), and are intended to be used only by the submittor.

The results for grain size, specific gravity, bulk and dry density, and Atterburg limits were provided by GeoTesting Express of Acton, Massachusetts and have been provided as an appendix to this report.

SAMPLE RECEIPT AND CONDITION DOCUMENTATION

STUDY NO: 29853
 SDG No: AMEC Foster Wheeler
 Project: SAEP Tidal Flats FS, Stratford, CT
 Delivered via: FedEX
 Date and Time Received: 10/20/17 0830 Date and Time Logged into Lab: 10/24/17 1518
 Received By: AM Logged into Lab by: AM
 Air bill / Way bill: No Air bill included in folder if received? NA
 Cooler on ice/packs: Yes Custody Seals present? NA
 Cooler Blank Temp (C) at arrival: 2 Custody Seals intact? NA
 Number of COC Pages: 16
 COC Serial Number(s): 4552
 COC Complete: Yes Does the info on the COC match the samples? Yes
 Sampled Date: Yes Were samples received within holding time? Yes
 Field ID complete: Yes Were all samples properly labeled? Yes
 Sampled Time: Yes Were proper sample containers used? Yes
 Analysis request: Yes Were samples received intact? (none broken or leaking) Yes
 COC Signed and dated: Yes Were sample volumes sufficient for requested analysis? Yes
 Were all samples received? Yes Were VOC vials free of headspace? NA
 Client notification/authorization: Not required pH Test strip ID number: NA

Notes and qualifications:

SAMPLE RECEIPT AND CONDITION DOCUMENTATION

STUDY NO: 29853
SDG No: AMEC Foster Wheeler
Project: SAEP Tidal Flats FS, Stratford, CT
Delivered via: FedEX
Date and Time Received: 10/20/17 0830 **Date and Time Logged into Lab:** 10/24/17 1518
Received By: AM **Logged into Lab by:** AM
Air bill / Way bill: No **Air bill included in folder if received?** NA
Cooler on ice/packs: Yes **Custody Seals present?** NA
Cooler Blank Temp (C) at arrival: 2 **Custody Seals intact?** NA
Number of COC Pages: 16
COC Serial Number(s): 4552
COC Complete: Yes **Does the info on the COC match the samples?** Yes
 Sampled Date: Yes **Were samples received within holding time?** Yes
 Field ID complete: Yes **Were all samples properly labeled?** Yes
 Sampled Time: Yes **Were proper sample containers used?** Yes
 Analysis request: Yes **Were samples received intact? (none broken or leaking)** Yes
COC Signed and dated: Yes **Were sample volumes sufficient for requested analysis?** Yes
Were all samples received? Yes **Were VOC vials free of headspace?** NA
Client notification/authorization: Not required **pH Test strip ID number:** NA

1.0 INTRODUCTION

Sediment samples were collected in the tidal flats at the Stratford Army Engine Plant (SAEP or Site) in Stratford, Connecticut in support of the feasibility study. Samples were collected in October 2017. The samples were analyzed by EnviroSystems in Hampton, New Hampshire. The samples were analyzed by the following U.S. Environmental Protection Agency (USEPA) and American Society for Testing and Materials (ASTM) International methods:

Laboratory	Parameter	Analytical Method	Validation Level
EnviroSystems	PCB Homologs	USEPA 8270 SIM/680 Modified	Stage 2A
EnviroSystems	Mercury	USEPA 245.7	Stage 2A
EnviroSystems	Total Solids	USEPA 160.3	Stage 1

A summary of samples included in this data validation report is presented in Table 1. The analytical data packages were reviewed in accordance with the general specifications for feasibility study (FS) data in the final SAEP Quality Assurance Project Plan (QAPP) [Amec Foster Wheeler Foster Wheeler, 2018].

The data were validated manually by the Amec Foster Wheeler project chemist following the USEPA Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use procedures (USEPA, 2009). Quality control (QC) limits established in the QAPP were used during data validation. A summary of validated sample results is presented in Table 2. Sediment samples are reported in micrograms per kilograms ($\mu\text{g}/\text{kg}$) and milligrams per kilogram (mg/kg). Elutriate and surface water results are reported in micrograms per liter ($\mu\text{g}/\text{l}$) and milligrams per liter (mg/l). A summary of data validation actions is presented in Table 3. Table 3 includes results for samples that have been qualified (data validation has resulted in revisions to the laboratory result) and any results with validation codes that have been applied by the project chemist. Table 3 includes final results and validation qualifiers and validation reason codes that define the actions.

In accordance with general data reporting procedures in the Department of Defense (DOD) Quality Systems Manual (QSM) [DOD, 2017], the laboratory reported results using a combination of three detection limits including the limit of quantitation (LOQ), limit of detection (LOD), and the method detection limit (MDL). Results for compounds that are not detected in samples are reported as U qualified results at the LOD. The laboratory reports positive detections above the MDL. Values between the MDL and the LOQ are qualified as estimated (J) by the laboratory.

2.0 PCB HOMOLOGs

Samples were analyzed for PCB Homologs by modified USEPA Method 8270 Selected Ion Monitoring (SIM)/680 Modified. A description of validation actions are presented in the following subsection. Data were evaluated based on the following parameters:

- * Data Completeness
 - * Holding Times and Preservation
 - * Blanks
 - Laboratory Control Sample (LCS/LCSD)
 - Matrix Spikes (MS/MSD)
 - Field Duplicate
 - Laboratory Duplicate
 - * Surrogate Recovery
 - * Detection Limits
 - * Sample Result Verification/Electronic Evaluation Verification (EDD)
- * = indicates that criteria were met for this parameter

Except for the validation actions noted below, sample results are interpreted to be usable as reported by the laboratory. A summary of final results is presented on Table 2. A summary of data validation actions is presented on Table 3.

2.1 Laboratory Control Sample

A summary of laboratory control sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of LCS-L.

SDG 29853

In the LCS/LCSD analyzed January 9, 2018, the LCSD percent recovery of monochlorobiphenyl (30) was less than the lower QC limit of 40. The reporting limit for monochlorobiphenyl and the result for total PCB in associated sample SDPCB1060001 was qualified estimated (J/UJ).

2.2 Matrix Spikes

A summary of matrix sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of MS-H and MS-L.

SDG 29853

Sample SDPCB0050001 was submitted for MS/MSD analysis. The MS and/or MSD percent recoveries of monochlorobiphenyl (0 and 0) and trichlorobiphenyl (141) were outside of the QC limits of 40 to 140. The result for monochlorobiphenyl in sample SDPCB0050001 was non-detect and was rejected (R). The result for trichlorobiphenyl and total PCBs in sample SDPCB0050001 were qualified estimated (J).

Sample SDPCB2050001 was submitted for MS/MSD analysis. MS and/or MSD percent recoveries for most of the analytes were zero. With the exception of monochlorobiphenyl, the unspiked sample concentrations were greater than five times the spiking concentration, no action required. The reporting limit for monochlorobiphenyl and the result for total PCBs in sample SDPCB0050001 were qualified estimated (J/UJ).

Sample SDPCB1060001 was submitted for MS/MSD analysis. The MS and/or MSD percent recoveries of monochlorobiphenyl (20), tetrachlorobiphenyl (37), hexachlorobiphenyl (167 and 167), and total PCBs (37) were outside of the QC limits of 40 to 140. The reporting limit for monochlorobiphenyl and the result for tetrachlorobiphenyl, hexachlorobiphenyl, and total PCBs in sample SDPCB1060001 were qualified estimated (J/UJ).

2.3 Field Duplicate

A summary of field duplicate sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of FD.

SDG 29853

Sample SDPCB0040102 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (64), tetrachlorobiphenyl (59), and trichlorobiphenyl (59) exceeded the QC limit of 50. The result for dichlorobiphenyl, tetrachlorobiphenyl, trichlorobiphenyl, and total PCBs in associated samples SDPCB0040102 and SDPCB0040102DP was qualified estimated (J).

Sample SDPCB0060102 was submitted for duplicate analysis. The duplicate RPD of heptachlorobiphenyl (60) and octachlorobiphenyl (62) exceeded the QC limit of 50. The result for heptachlorobiphenyl, octachlorobiphenyl, and total PCBs in associated samples SDPCB0060102 and SDPCB0060102DP was qualified estimated (J).

Sample SDPCB0070001 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (64), heptachlorobiphenyl (87), nonachlorobiphenyl (68), octachlorobiphenyl (55), total PCBs (77), pentachlorobiphenyl (88), tetrachlorobiphenyl (73), and trichlorobiphenyl (87) exceeded the QC limit of 50. The result for dichlorobiphenyl, heptachlorobiphenyl, nonachlorobiphenyl, octachlorobiphenyl, total PCBs, pentachlorobiphenyl, tetrachlorobiphenyl, and trichlorobiphenyl in associated samples SDPCB0070001 and SDPCB0070001DP was qualified estimated (J).

Sample SDPCB1020102 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (57) and tetrachlorobiphenyl (54) exceeded the QC limit of 50. The result for dichlorobiphenyl, and tetrachlorobiphenyl in associated samples SDPCB1020102 and SDPCB1020102DP was qualified estimated (J).

Sample SDPCB1080001 was submitted for duplicate analysis. The duplicate RPD of dichlorobiphenyl (68) exceeded the QC limit of 50. The result for dichlorobiphenyl in associated samples SDPCB1080001 and SDPCB1080001DP was qualified estimated (J).

Sample SDPCB3000405 was submitted for duplicate analysis. The duplicate RPD of total PCBs (113), pentachlorobiphenyl (123), tetrachlorobiphenyl (100), and trichlorobiphenyl (117) exceeded the QC limit of 50. The result for total PCBs, pentachlorobiphenyl, tetrachlorobiphenyl, and trichlorobiphenyl in associated samples SDPCB3000405 and SDPCB3000405DP was qualified estimated (J).

Sample SDPCB3030405 was submitted for duplicate analysis. The duplicate RPD of total PCBs (155), pentachlorobiphenyl (146), and tetrachlorobiphenyl (143) exceeded the QC limit of 50. The result for total PCBs, pentachlorobiphenyl, and tetrachlorobiphenyl in associated samples SDPCB3030405 and SDPCB3030405DP was qualified estimated (J).

Sample SDPCB3040405 was submitted for duplicate analysis. The duplicate RPD of heptachlorobiphenyl (123), nonachlorobiphenyl (72), and total PCBs (186) exceeded the QC limit of 50. The result and reporting limits for heptachlorobiphenyl, nonachlorobiphenyl and total PCBs in associated samples SDPCB3040405 and SDPCB3040405 were qualified estimated (J/UJ).

2.4 Laboratory Duplicate

A summary of laboratory duplicate sample actions is presented in Table 3 with results being assigned a validation qualifier reason code of LD.

SDG 29853

Sample SDPCB3040506 was selected by the laboratory for duplicate analysis. The RPD between the sample and duplicate analysis for tetrachlorobiphenyl (34) exceeded the laboratory QC limit of 30. The result for tetrachlorobiphenyl in sample SDPCB3040506 was qualified estimated (J).

3.0 MERCURY

Samples were analyzed for mercury by USEPA Method 245.7. A description of validation actions are presented in the following subsection. Data were evaluated based on the following parameters:

- * Data Completeness
 - * Holding Times and Preservation
 - * Blanks
 - * Laboratory Control Sample (LCS)
 - * Matrix Spikes (MS/MSD)
 - * Field Duplicate
 - * Laboratory Duplicate
 - * Detection Limits
 - * Sample Result Verification/Electronic Evaluation Verification (EDD)
- * = indicates that criteria were met for this parameter

Results are usable as reported by the laboratory. A summary of final results is presented on Table 2.

Units:

UG/KG = microgram per kilogram

Validation Reason Codes:

LCS-L = LCS recovery low
 FD = Field duplicate limit exceeded
 LD = Laboratory duplicate limit exceeded
 MS-H = Matrix spike recovery high
 MS-L = Matrix spike recovery low

Validation Qualifier:

U = not detected above the reported concentration
 UJ = not detected above the reported concentration and is estimated
 J = value is estimated
 R = result is rejected

DRAFT FINAL Focused Feasibility Study

APPENDIX A-3

Potential Pre-Design Sediment Investigations

**Potential Pre-Design Sediment Investigations
Stratford Army Engine Plant Focused Feasibility Study**

As indicated in the FFS, the investigations conducted in the Tidal Flats have adequately characterized the contamination in sediments exceeding PRGs and requiring remediation. However, there remains the possibility of residual contamination exceeding background concentrations at depths greater than 4 feet bgs in the Tidal Flats from historic activities at SAEP, as well as former industrial processes along Housatonic River. Future exposure to the potential presence of detectable contamination at depths below 4 feet is not anticipated; however, the Army proposes some limited pre-design sediment characterization in those areas where ERM-Q > 0.5 in the 3-4 foot, bgs interval to evaluate those areas to a depth of 6 feet bgs.

Figure A.3-1 presents the seven areas of the proposed 3-4 ft, bgs excavation interval, as well as the ERM-Q values for samples collected in the 3-4 ft, bgs depth interval. Each of the seven areas presented on Figure A.3-1 have concentrations of contaminants of potential concern exceeding preliminary remedial goals (PRGs). The ERM-Q values (and/or mercury and PCB concentrations) exceed the remedial goal of 0.5 in six of the seven excavation areas (B-1, B-7, E-7, H-1, H-5, L-3), and mercury exceeds the remedial goal of 0.4 ppm in excavation area E-0. Table A.3-1 presents the maximum detected concentration of potential contaminants of concern for each of the seven areas for the depth intervals 3-4, 4-5, and 5-6 feet bgs. Red highlighting of values in the table indicates that a value/concentration exceeds its' respective PRG. Yellow highlighting indicates a potential data gap for that excavation area, depth interval, and analyte.

As shown in Table A.3-1, there is analytical data for the 4-5 and/or 5-6 ft bgs intervals in excavation areas B-1, E-0, and H-1. The potential driver for additional sediment data collection at excavation E-0 is a mercury concentration of 1.9 ppm in the 3-4 ft, bgs depth interval, but maximum concentrations of mercury less than the PRG of 0.4 ppm in 4-5 and 5-6 ft, bgs samples from the E-0 area preclude the need for any additional investigations (Table A.3-1). The remaining six excavation areas are lacking vertical delineation of potential contaminants, and the proposed depth intervals and analytes for additional sampling are presented in Table A.3-1 with yellow highlighting. Figure A.3-1 presents potential locations for sediment core collection to delineate potential metals (ERM-Qs), total PCBs and mercury for the 4-5 and 5-6 ft, bgs depth intervals beneath excavation areas B-1, B-7, E-7, H-1, H-5, and L-3. No investigations of sediment at depths greater than 6 feet, bgs will be conducted by the Army.

The proposed investigations will be conducted prior to the completion of the Design. The Design will specify any additional excavation required as a result of additional contamination detected above PRGs in the 4-6 ft, bgs depth interval. The Army will not conduct any sediment excavation to depths greater than 6 feet, bgs in the Tidal Flats.

TABLE A.3-1

TIDAL FLATS 3-4 FEET BGS DEPTH INTERVAL CONTAMINANT CONCENTRATIONS AND POTENTIAL DATA GAPS IN THE 4-6 FEET BGS DEPTH INTERVAL

DRAFT FINAL Focused Feasibility Study

APPENDIX A-4

Evaluation of 2006 through 2015 LiDAR Elevation Data – Tidal Flats

Objectives:

- 1) Evaluate impact of Hurricane Sandy (October 2012) on the elevation of Tidal Flats sediments (i.e., was there any impact to sediment surface, and if so, how much?)
- 2) Evaluate sedimentation rates for the Tidal Flats (as available LiDAR data allow)

LiDAR Data Sets:

LiDAR data sets for selected years spanning 2006 through 2015 for the Stratford, Connecticut area are available from the following websites:

http://cteco.uconn.edu/data/lidar/info_lidar.htm (2006, 2012, 2015)

https://coast.noaa.gov/htdata/lidar1_z/

Wood selected the following LiDAR data sets from the websites for evaluation of Tidal Flats historical sediment elevations:

CT Coast 2006

December 2006

Area 187 sq mi

Acquired By FEMA

Projection CT State Plane NAD83 feet, NAVD88 feet

Coast 2012

November 14 to December 16, 2012

Area 116 sq mi

Acquired By US Army Corps of Engineers

Projection Geographic, NAD83 meters, NAVD88 meters

Note: survey conducted shortly after passage of Hurricane Sandy

2015 USACE NAE Topobathy Lidar DEM: Connecticut

June 5, 2015 through June 13, 2015

Acquired By US Army Corps of Engineers

Projection NAD83 meters, NAVD88, using the GEOID12B grids provided by the National Geodetic Survey

A preliminary review of available LiDAR datasets was performed to evaluate feasibility of performing differential LiDAR analysis for the project site. Publicly available datasets have been acquired by various state and Federal agencies during the time span of 2006-2016. The time range of these data encompass the occurrence of Hurricane Sandy (2012) and therefore may be used to evaluate the topographic geomorphic effects of the 2012 Hurricane Sandy event on the site vicinity. Due to variations in tidal cycles during acquisition of some of these data, there is intrinsic variability in the lateral extent of the tidal flat areas scanned by the LiDAR.

The CT Coast (2006) data set includes mudflat elevation data that was acquired during semi-low tide conditions and includes what appear to be sand-bar depositional features at the end of the Causeway. Subsequent to, and as a result of, Hurricane Sandy, USACE collected the Coast 2012 "Post-Sandy" LiDAR dataset. This data was collected to evaluate effects of Hurricane Sandy on the coastal region; however, flight paths yielded only partial coverage of this study area in Stratford CT. This dataset does provide

APPENDIX A-4

Evaluation of 2006 through 2015 LiDAR Elevation Data – Tidal Flats Stratford Army Engine Plant Focused Feasibility Study

September 21, 2018

sufficient coverage for differential LiDAR analysis and so was used with limitations and the caveat that it only represents a percentage of the Tidal Flats area. In 2015, USACE (NAE) acquired a green-LiDAR topobathymetric scan of the study area. A derivative digital elevation model (DEM) surface of this 2015 dataset (NAE) was used as the base for comparison. It included all areas considered intertidal and has the most consistent returns and ground classifications of the three LiDAR data sets used in this evaluation.

Data Processing:

LiDAR data points within the area of the Tidal Flats were extracted for each of the three data sets referenced above. The point clouds, containing irregularly-space points were compared against elevation values within the 2015 DEM. Comparisons of the data sets to evaluate elevation differences over three time periods were made:

- 2006 - 2012 Elevation Differences (2006 to immediately after Sandy)
- 2012 - 2015 Elevation Differences (immediately following Sandy to 2015)
- 2006 - 2015 Elevation Differences (pre-Sandy to 2015)

Histograms representing the difference in elevations for each of the comparative data sets were generated and are presented in the attached Figures 1 through 3. Note that negative values in the histograms represent an increase in sediment elevation, while positive values represent a decrease in elevation.

Preliminary Observations:

The following table presents a summary of statistics for the three elevation data set comparisons (2006 - 2012 (post-Sandy), 2012 (post-Sandy) - 2015, and 2006 – 2015), with negative values indicating an increase in sediment elevation:

Data Set Comparison	Number of Elevation Measurement Points in Comparison	Largest Single Point Sediment Elevation Increase (feet)	Largest Single Point Sediment Elevation Decrease (feet)	Mean Sediment Elevation Differential (feet)	Estimated Mean Sedimentation Rate (ft/yr)
2006 - 2012 (post-Sandy)	105,631	-1.00	1.00	-0.14	-0.02
2012 (post-Sandy) - 2015	130,831	-2.02	2.40	-0.22	-0.07
2006 - 2015	198,537	-3.87	4.75	-0.39	-0.04

Note: Negative values represent an increase in sediment elevation

2006-2012 (post-Sandy): See attached Figure 1. The histogram presented in Figure 1 indicates that of the >105,000 elevation measuring points that the LiDAR data sets have in common, the majority exhibit an increase in elevation of 0.1 to 0.2 feet (mean = 0.14 feet) over this 6-year period, inclusive of the Hurricane Sandy event. Approximately 17.5% of the measurement points indicate a decrease in sediment elevation, primarily located along the Dike/shoreline east of the Causeway. The mean sedimentation rate for the Tidal Flats area covered in this data comparison is 0.02 ft/yr.

2012 (post-Sandy) - 2015: See attached Figure 2. The histogram presented in Figure 2 indicates that of the >130,000 elevation measuring points that the LiDAR data sets have in common, the majority exhibit an increase in elevation of 0.2 to 0.3 feet (mean = 0.22 feet) over this 3-year period following the Hurricane Sandy event. Only a very small percentage (< 1%) of the measurement points indicate a decrease in sediment elevation, primarily located on the southern side of the breakwater bordering the Housatonic River, as well as along the Dike/shoreline east of the Causeway. The mean sedimentation rate for the Tidal Flats area covered in this data comparison is 0.07 ft/yr.

2006-2015: See attached Figure 3. The histogram presented in Figure 3 indicates that of the >195,000 elevation measuring points that the LiDAR data sets have in common, the majority exhibit an increase in elevation of 0.4 to 0.5 feet over this 9-year period encompassing the Sandy event in October 2012. Only a very small percentage (< 1%) of the measurement points indicate a decrease in sediment elevation. The mean sedimentation rate for the Tidal Flats area covered in this data comparison is 0.04 ft/yr.

Preliminary Conclusions:

- Over the six-year time period between 2006 and 2012, the mean sediment elevation of the Tidal Flats increased by 0.14 feet. Using a non-Sandy influenced estimation of sedimentation rate between 2012 and 2015 of 0.07 ft/yr, and extrapolating over the 2006-2012 period of six years, yields a theoretical sediment accumulation of 0.42 feet. Subtracting the measured mean sediment elevation difference of 0.14 between 2006 and 2012 (post-Sandy) from the theoretical estimate of 0.42 feet, results in an estimated mean elevation difference of 0.28 feet, which could be theorized as the mean decrease in elevation resulting from Hurricane Sandy.
- The three data set comparisons indicate an increase in sediment elevation over their respective time periods, with only a very low percentage (<1%) of the measurement points indicating a decrease in sediment elevation.
- Evaluation of LiDAR data by Wood indicates that between 2006 and 2015, the elevation of the Tidal Flats sediments generally increased, with a mean increase of 0.39 feet over the 9-year period inclusive of Hurricane Sandy. As Hurricane Sandy likely impacted the calculated sedimentation rate estimated for the time periods 2006-2012 (0.02 ft/yr) and 2006-2015 (0.04 ft/yr), the timeframe between 2012 (post-Sandy) and 2015 is expected to reflect the most reasonable average sedimentation rate which is 0.07 ft/yr.
- Using a sedimentation rate of 0.07 ft/yr, it is estimated that it would take roughly 14 years for a 1-foot thickness of new sediment to accumulate on the Tidal Flats. However, this does not take into account that if the Tidal Flats were excavated and backfilled to 1 foot below existing grade, the non-equilibrium condition generated by leaving the last 1-foot unfilled would likely increase the rate of sedimentation. Increases in sedimentation rates have been documented at other sediment excavation sites where excavations have not been completely backfilled to grade (<http://www.nae.usace.army.mil/Portals/74/docs/DAMOS/TechReports/186.pdf>).

NDDB DETERMINATION NUMBER.: 201804649

Project: Remediation of tidal flats by dredging and transfer of property for redevelopment under Stewardship Permit for Stratford Army Engine Plant (SAEP), 550 Main Street in Stratford

I have reviewed Natural Diversity Data Base (NDDB) maps and files regarding this project. I do not anticipate negative impacts to State-listed species (RCSA Sec. 26-306) resulting from your proposed activity at the site. This determination is good for 2 years. Please re-submit an NDDB Request for Review if the scope of work changes or if work has not begun on this project by April 23, 2020.

Natural Diversity Data Base information includes all information regarding critical biological resources available to us at the time of the request. This information is a compilation of data collected over the years by the Department of Energy and Environmental Protection's Natural History Survey and cooperating units of DEEP, private conservation groups and the scientific community. This information is not necessarily the result of comprehensive or site-specific field investigations. Consultations with the Data Base should not be substitutes for on-site surveys required for environmental assessments. Current research projects and new contributors continue to identify additional populations of species and locations of habitats of concern, as well as, enhance existing data. Such new information is incorporated into the Data Base as it becomes available. The result of this review does not preclude the possibility that listed species may be encountered on site and that additional action may be necessary to remain in compliance with certain state permits.

Please contact me if you have further questions at shannon.kearney@ct.gov . Thank you for consulting the Natural Diversity Data Base.

Sincerely,

/s/ Shannon B. Kearney
Wildlife Biologist

1.0 SEDIMENT AND SURFACE WATER SAMPLING FOR TREATABILITY TESTING AND ENGINEERING PARAMETERS

Sediment sample collection was completed for purposes of evaluating the required treatment for sediment for on-site consolidation, off-site disposal, and for dewatering fluids generated during sediment processing. Sediment samples were collected from areas with historically higher concentrations of PCBs, metals, and mercury, and from hydrodynamically diverse areas of the site (shallow vs. deep water, near shore vs. near river, near outfalls, and opposites sides of the causeway) to ensure collection of sediments from potentially differing depositional environments (e.g., representation of variability in sediment grain size and contaminant distribution). These areas were selected to ensure that sediments that are potentially more difficult to dewater were tested, so that dewatering and water treatment performance would be adequately assessed. In addition, areas were selected to provide vertical representation of sediment characteristics for the proposed dredge prism.

Samples were collected from 4 areas. **Table C-1** summarizes the sampling locations, rationale, and analyses run on the samples.

1.1 Surface Water Sample Collection

Surface water samples were collected prior to any sediment disturbance. A total of five surface water samples were collected according to the following:

- ▶ **Area 1.** 55 gallons collected for treatability study makeup water (SW-01-001-0001) and 10 gallons collected for modified elutriate study makeup water (SW-01-002-0001);
- ▶ **Area 6.** Ten gallons collected for modified elutriate study makeup water (SW-06-001-0001); and
- ▶ **Area 8.** Ten gallons collected for modified elutriate study makeup water (SW-08-001-0001).

1.2 Modified Elutriate, Geotechnical, Waste Characterization, and Treatability Testing

Figure C-1 presents the locations of sediment samples collected for treatability studies and other engineering evaluations. Two sampling events were conducted: the first in early August 2017 and the second in October 2017. The first event was conducted per the FSP sampling rationale. The second event in October 2017 was conducted to provide additional geotechnical data from across the entire site. The locations for the October 2017 event are labeled in a light green with the series SDT-501 through SDT 510.

The treatability and engineering parameter sample locations are shown in purple as Areas 1, 4, 6, and 8 on **Figure C-1** (August 2017 sampling event). Generally, the cores were all collected within pre-selected areas identified by the purple areas. For each Area, each core collected is identified in green with an exploration ID (e.g., SDT-01-008, “sediment”, “Area 01”, “location 008”). In addition, for each area, there is a callout box that identifies the full sample code with the

parameters selected for analyses. These parameters include: modified elutriate (noted as “elutriate,” total PCBs/Metals, geotechnical (parameters include bulk and dry density, specific gravity, Atterberg limits, and moisture content), TOC and grain size/hydrometer, SPLP PCBs/Metals, hazardous waste parameters, TPH, treatability testing, and percent solids). The depth of each core is indicated per the color coding:

- ▶ Area 1, 4 ft;
- ▶ Area 4, 2 ft;
- ▶ Area 6, 4 ft; and
- ▶ Area 8, 2 ft.

A sample collection matrix for August 2017 sampling event is presented in **Table C-1** (same as Table 4-3 from the FSP). The actual sampling included the collection of 74 sediment cores and five gallons of sediments by hand shovel according to the following:

- ▶ **Area 1.** Nineteen cores advanced to four feet below sediment surface (bss) from Area 1- SDT-01-001 through SDT-01-019 designated for analysis as follows:
 - ▶ SDT-01-001 through SDT-01-017 comprising the composites for Area 1 treatability testing and modified elutriate analysis;
 - ▶ SDT-01-018 for SPLP PCBs and Metals for the intervals 0 to 2 ft and 2 to 4 ft; and
 - ▶ SDT-01-019 for geotechnical and TOC/grain size for the 0 to 1ft, 1 to 2 ft and 2 to 4 ft intervals.
- ▶ **Area 4.** 24 sediment cores advanced to two feet bss from Area 4 – SDT-04-020 through SDT-04-041 and SDT-04-050,051 designated for analyses as follows:
 - ▶ SDT-04-020 through SDT-04-041 and five gallons of sediment collected from 0 to 2 ft bss using a hand shovel, comprising the composite for Area 4 treatability testing; and
 - ▶ SDT-04-050 for SPLP PCBs and metals for the interval 0 to 2 ft bss; and
 - ▶ SDT-04-051 for geotechnical, TOC, and grain size for the 0 to 1 ft and 1 to 2 ft intervals.
- ▶ **Area 6.** Four sediment cores advanced to four ft bss from Area 6 – SDT-06-052 through SDT-06-055, designated for analyses as follows:
 - ▶ SDT-06-052 and SDT-06-053 comprising the composites for Area 6 modified elutriate analysis;
 - ▶ SDT-06-054 for SPLP PCBs and metals for the interval 0-4 ft bss; and
 - ▶ SDT-06-055 for geotechnical, TOC, and grain size for the 0 to 1 ft, 1 to 2 ft, and 2 to 4 ft intervals.

- ▶ **Area 8.** 26 sediment cores advanced to two feet bss from Area 8 – SDT-08-056 through SDT-08-081, designated for analyses as follows:
 - ▶ SDT-08-056 through -079 comprising the composites for Area 8 modified elutriate analysis and treatability testing;
 - ▶ SDT-08-080 for SPLP PCBs and metals for the interval 0-2 ft bss; and
 - ▶ SDT-08-081 for geotechnical, TOC, and grain size for the 0 to 1 ft, and 1 to 2 ft bss intervals.

Table C-1 also notes where there were slight differences between the analyses run compared with the analyses planned in the FSP.

During the October 2017 event, ten cores were collected, composited over the entirely interval collected, and submitted for geotechnical parameters (grain size/hydrometer, bulk and dry density, Atterberg limits, moisture content, and specific gravity). The borings and intervals sampled included the following:

- ▶ SDT-501, 0 to 3 ft bss;
- ▶ SDT-502, 0 to 1 ft bss;
- ▶ SDT-503, 0 to 2 ft bss;
- ▶ SDT-504, 0 to 1 ft bss;
- ▶ SDT-505, 0 to 2 ft bss;
- ▶ SDT-506, 0 to 1 ft bss;
- ▶ SDT-507, 0 to 4 ft bss;
- ▶ SDT-508, 0 to 1 ft bss;
- ▶ SDT-509, 0 to 2 ft bss; and
- ▶ SDT-510, 0 to 1 ft bss;

All cores were collected using Piston-Vibracore® drilling/sampling methods.

Table C-2 summarizes the analyses performed on all of the sample IDs. Attachment A includes the field data collection form for the sediment and surface water sampling events.

2.0 ELUTRIATE RESULTS

Modified elutriate analyses were run on 3 samples collected from Areas 1, 6, and 8. These areas were selected for elutriates because they represented relatively high concentrations of site contaminants, particularly PCBs and were considered representative of a variety of hydrodynamic conditions across the site. The modified elutriate analysis, as described in the Inland Testing Manual (USACE 2003), was selected because it is designed to simulate water quality when hydraulically dredged materials are placed in a CDF, allowed to settle, and decant water flows over a weir for further treatment or return to the water body. This is a reasonable representation of water quality generated from dewatering of dredged sediments.

Tables C-3 through **C-5** summarize the modified elutriate analyses, including the parent surface water and sediment used to make the elutriates. **Attachment C** includes the lab data reports for all analyses run.

2.1 Area 1 Elutriate Results

Area 1. At Area 1, which is just off the tip of the causeway, copper exceeded the state acute water quality criterion of 4.8 µg/L, at concentrations ranging from 12.8 to 13.3 µg/L in the three unfiltered replicates. Copper did not exceed the SB criterion in the filtered samples. All other metals did not exceed their respective criteria.

For PCBs, a number of exceedances of the state criterion of 0.03 µg/L PCBs in both the total and centrifuged samples were detected. In uncentrifuged samples, tri-, tetra-, penta-, and hexachlorobiphenyl exceeded the criterion in all three replicates, ranging in concentration from 0.038 to 0.51 µg/L, while heptachlorobiphenyl exceeded the criterion in only one replicate at 0.037 µg/L. Total PCBs exceeded the criterion at concentrations ranging from 0.82 to 0.95 µg/L.

Centrate analyzed for PCBs also exceeded the SB criterion of 0.03 for all congeners quantitated except for chlorobiphenyl and decachlorobiphenyl. Concentrations ranged from 0.094 to 6.5 µg/L for the exceedances in di- through decachlorobiphenyl congeners. Total PCBs ranges from 0.15 to 12 µg/L.

2.2 Area 6 Elutriate Results

Area 6. At Area 6, which is nearshore east of the causeway, copper in the unfiltered elutriate exceeded State saltwater acute water quality standard of 4.8 µg/L (Class SB) with results of the three replicates ranging from 34.4 to 37.1 µg/L. All filtered results for metals passed the Class SB standards. However, it is important to note that the surface water collected from the site also exceeds the state SB standard at a concentration of 5.2 µg/L.

PCB analysis shows exceedance of the state acute value of 0.03 µg/L for tetrachlorobiphenyl at 0.04 to 0.046 in uncentrifuged samples. No individual PCB congeners exceed the state SB criterion in the centrifuged samples. However, all total PCB results are noted as undetected at 0.11U, which is above the criterion.

2.3 Area 8 Elutriate Results

Area 8. At Area 8, which is a relatively nearshore area west of the causeway and near Outfalls 002, 003, 004, and 007, there were no metals exceedances in either the total of filtered elutriate water samples. Copper in surface water collected as makeup water for the elutriates exceeded the standard of 4.8 µg/L at a concentration of 18.8 µg/L.

PCBs in the uncentrifuged samples exceeded the standard of 0.03 µg/L only slightly for one congener, tetrachlorobiphenyl, at concentrations of 0.033 µg/L in two out of three replicates. There were no detections in centrate exceeding the standard; however, total PCBs had an elevated detection limit of 0.11 µg/L in all replicates including the raw makeup surface water sample.

2.4 Conclusions

Comparison to water quality standards (State Acute SB) for the elutriate samples analyzed from the three areas of the site shows the following:

- Area 1 - PCBs in both total and dissolved fractions and copper only in the total fraction exceeded water quality standards;
- Area 6 - Both PCBs and copper exceeded water quality standards in the total fraction; however, neither exceeded in the dissolved fraction; and
- Area 8 – Only PCBs exceeded water quality standards in the total fraction.

In conclusion, to ensure that the water treatment system can treat all site contaminants and meet likely water quality standards, both particle filtration and carbon adsorption may be needed to treat dewatering fluids generated from sediments dredged from the site. Additional dewatering technology specific evaluations were conducted to further evaluate these concerns.

3.0 GEOTECHNICAL ANALYSES

Geotechnical analysis was completed on 15 samples collected in the August 2017 event, of which 5 were composites (from 4 areas of the site and the master treatability composite sample) and 10 were from discrete intervals collected from cores advanced at four areas of the site. The analyses included bulk and dry density, moisture content, specific gravity, Atterberg limits, grains size/hydrometer, TOC, and % solids.

In a second mobilization in October 2017, ten additional samples were collected from locations across the entire site. These samples were collected each from an individual borings advanced to the proposed depth of dredging (either 1, 2, 3, or 4 ft bss) and composite from zero to the depth of the recovered core. These samples were analyzed for the same geotechnical parameters as the samples collected in August 2017.

The purpose of these samples was to support the dredge feasibility analysis and determine variability across the site and with depth.

Table C-6 summarizes the geotechnical results and **Table C-7** summarizes organic carbon results and additional percent solids results.

3.1 Area 1 Geotechnical

Discrete samples from Area 1 range in silt content from 55% to 78%, while clay ranges from 16.7% to 22.6%. Sand ranges from 5.2 to 21.8%. Samples are classified as silt with sand or silt (all MH). Liquid limits (LL) ranged from 73 to 113, plastic limit (PL) ranged from 36 to 46, and the plasticity index (PI) ranged from 37 to 42 (**Table C-6**). In situ percent solids range from 41.9% to 49.4% (see **Table C-7**). Organic carbon ranges from 1.9 to 3.5%. Percent solids range from 41.9 to 49.4%.

3.2 Area 4 Geotechnical

Discrete samples from Area 4 range in silt content from 56 to 71.7% silt and 14.5 to 18.6% clay. Sand ranges from 9.7 to 29.5%. Descriptions include silt with sand and silt (all MH). LL ranged from 54 to 90, PL ranged from 35 to 48, and the PI ranged from 19 to 42 (**Table C-6**). Organic carbon ranges from 2.0 to 2.3%. Percent solids range from 52.3 to 56.2% (**Table C-7**).

3.3 Area 6 Geotechnical

For Area 6, discrete samples range in silt content from 29.1 to 67.7%, with clay ranging from 7.5 to 27.8%, and sand ranging from 4.5 to 62.8%. Descriptions include silt with sand, sand/sandy silt, clay with sand, and silt (MH, SM/ML, and CH). This area shows considerable variability in the sand and clay contents. LL ranged from 42 to 102, PL ranged from 30 to 45, and the PI ranged from 12 to 57 (**Table C-6**). Percent solids range from 46.5 to 65.6% and organic carbon ranges from 1.3 to 3.7% (**Table C-7**).

3.4 Area 8 Geotechnical

At Area 8, discrete samples range in silt content from 59.9% to 71.2% and clay content ranges from 17.6 to 21.8%. Sand content ranges from 11.2 to 18.3% and descriptions include silt with sand, silt, and sandy silt (all MH). LL ranged from 64 to 68, PL ranged from 34 to 43, and the PI ranged from 29 to 30 (**Table C-6**). Percent solids range from 52.4 to 58.3% and organic carbon ranges from 1.7 to 2.4% (**Table C-7**).

3.5 Site Wide Geotechnical

For the site wide samples collected from a range of areas and depths across the entire site (the "500 series of samples), silt content ranges from 17 to 66% and clay content ranges from 4 to 20%. Sand content ranges from 16.5 to 71.9% and descriptions include silt, silt with sand, sandy silt, and silty sand (MH, SM, and SM/ML). One sample was non-plastic. For plastic samples, LL ranged from 36 to 82, PL ranged from 33 to 41, and the PI ranged from 3 to 41 (**Table C-6**). Percent solids range from 50.4 to 75.9% and organic carbon ranges from 0.3 to 1.98% (**Table C-7**).

Bulk (wet) densities range from 81.5 to 112.5 pounds per cubic foot (pcf) and dry density ranges from 34.8 to 85.4 pcf. Specific gravity ranges from 2.5 to 2.68 (**Table C-6**).

3.6 Treatability Composite Geotechnical

For the master composite sample used for treatability testing, 59.9% was silt and clay, with 38.4% sand, and 1.7% gravel, with a description of sandy silt (MH). The LL was 72 (site range 36 to 113, average 71), PL was 43 (site range 30 to 46, average 39), and the PI was 29 (site range 3 to 67, average 33). Bulk (wet) density was 90.3 pcf (site average 95 pcf) and dry density was 50.1 pcf (site average 54.3). Specific gravity was 2.61 (site average 2.61). Percent solids was 55.5% (55.4% site wide average).

Results for the master composite sample (SDT-XX-COMP-001), blended together from the three composite samples collected from Areas 1, 4, and 8, show that it is a good average representation of overall geotechnical conditions at the site when compared against recent data collected across the site.

4.0 RAW SEDIMENT SPLP

A total of 5 discrete samples (composited over specific depth intervals) from 4 different areas of the site were collected and analyzed for SPLP metals and PCBs (see **Table C-8**). In addition, 4 composite samples were analyzed for SPLP metals and PCBs (one from each of three areas and the fourth being a composite of the first three). In addition, one of the samples, SDT-04-050-0002 was analyzed for total and SPLP VOCs due to the suspected presence of VOCs in this sample.

The purpose of these samples was to compare raw sediment SPLP results against state of CT GWB standards to assess potential for leaching to groundwater, to determine if sediment can be placed on-site for re-use as fill. In addition, the discrete and composite samples provide both a worst case and typical blended cases of dredged sediment.

The results show no exceedances of either metals or PCBs (individual congeners or total PCBs) of the GW B standards. Only mercury, in one sample (SDT-06-054-0004), was at the state limit of 20 µg/L.

These results show that untreated sediment meet state GW B standards for leachability to groundwater and can be placed on the site and re-used beneficially as fill material for future development needs.

5.0 WASTE CHARACTERIZATION ANALYSIS

Table C-9 presents the results of waste characterization analyses and **Table C-10** presents the SPLP VOC results. Hazardous waste parameters were analyzed for the three composite samples of sediments used for treatability testing. Each of these samples were analyzed for total VOCs, PCBs, TAL metals, ignitability, corrosivity, reactivity, and TCLP VOCs and metals. In addition, these samples were also analyzed for TPH due to the suspected presence of petroleum in the samples based on odor and sheen observed. The purpose of these samples was to determine whether or not dredged material would be characterized as hazardous waste for off-site disposal purposes.

Additionally, the treatability master composite sample, blended from the three individual composites, was analyzed for PCBs, metals, and TCLP metals to verify RCRA status and concentrations of site contaminants for purposes of treatability testing.

Results show that the samples are not considered hazardous waste by any of the characteristics (ignitability, corrosivity, reactivity, and toxicity [TCLP metals and VOCs]). PCB results show low levels less than one mg/kg, verifying that the material can be placed on site and beneficially reused based on PCB concentration.

TPH concentrations present in the Area 1 composite may be a concern for on-site placement due to the result of 3,560 mg/kg slightly exceeding the state industrial/commercial direct exposure standard of 2,500 mg/kg. Additional characterization and/or development of alternative direct exposure criteria in accordance with CT RSRS 22a-133k-2 (a) may be needed to determine the applicability of placement of this limited volume of sediments on-site for beneficial re-use.

All total metals concentrations are well below applicable industrial/commercial direct exposure criteria with the exception arsenic, which ranged in concentration from approximately 5 to 8 mg/kg as compared with the standard of 10 mg/kg.

6.0 TREATABILITY SAMPLES

A total of 40 gallons of sediment were collected August 2-3, 2017 from areas 1, 4 and 8 of the site and placed in 5 gallon buckets. A total of 15 gallons from Area 1, 15 gallons from Area 4, and 10 gallons from Area 8 were collected. At Area 1, all samples were collected via coring to a depth of 4 ft. Recovered sediment was placed in five gallon pails. Similarly, at Area 4, 10 gallons of sediment were collected via coring to a depth of 2 feet, and an additional 5 gallons were collected using a shovel. This volume was added at the end of the field program to ensure sufficient volume was collected for the planned treatability testing. At Area 8, samples were collected via coring to a depth of 2 ft. These samples were labeled SDT-01-COMP-001, SDT-04-COMP-001, and SDT-08-COMP-001. Each of these samples were analyzed for PCB congeners, site metals, geotechnical parameters, TOC, grain size/hydrometer, SPLP PCBs and metals, hazardous waste characteristics, and percent solids. Additionally TPH was analyzed on the samples collected from Areas 1, 4, and 8 due to the suspected presence of weather fuel. **Table C-11** summarizes the results for each of these samples.

In addition, 55 gallons of surface water were collected prior to any sediment disturbance at Area 1 and placed in 5-gallon buckets. This sample was labeled SW-01-001-0001. The surface water was collected for use in generating sediment slurries to simulate dredged material to undergo various dewatering and subsequent solidification and water treatment tests.

The samples were delivered via truck to Mineral Processing Services (MPS), a treatability testing laboratory in South Portland, ME on August 6, 2017. The samples were stored in a warehouse at ambient conditions. On August 21, 2017, an Amec Foster Wheeler technician went to MPS to work with MPS staff to thoroughly composite each bucket set and subsample the well mixed composite. **Table C-1** lists the parameters analyzed. Following compositing and sampling, the entire 40 gallons of sediment was composited into a single sample, which was then also subsampled for analysis as indicated in **Tables C-1** and **C-2** (sample ID: SDT-XX-COMP-001). This fully mixed composite sample was then analyzed for various treatability tests.

A single 5-gallon bucket of this fully mixed composite was shipped to Weeks Geotechnical Laboratory at Rutgers University in Piscataway, NJ on August 23, 2017. This sample underwent solidification testing simulating the process of pneumatic flow tube mixing (PFTM) that is being evaluated as part of the remedial alternative for conveyance, solidification, and placement of processed sediments. This process is also known as "Tipping Point."

For the remainder of the treatability tests, the initial plan was to perform the testing at MPS's laboratory. However, due to scheduling issues, Amec Foster Wheeler procured a replacement lab to perform the work. Kemron of Atlanta, GA was selected to do the work. The samples were picked up from MPS in South Portland and driven to Kemron's lab in Atlanta, arriving on 6 October 2017.

7.0 KEMRON DEWATERING, SOLIDIFICATION, AND WATER TREATMENT TREATABILITY STUDY

Kemron began the treatability work on October 6, 2017. A detailed treatability report by Kemron is included in **Attachment C**. This section includes a summary of the work and relevant conclusions with respect to assumptions used in the FFS.

Treatability Testing was performed to accomplish the following:

- ▶ Characterize raw waste physical characteristics
- ▶ Determine effective polymers needed for dewatering
- ▶ Assess dewatering behavior for the following technologies
 - ▣ Gravity dewatering
 - ▣ Mechanical Dewatering
 - Belt Filter Press
 - Recessed Chamber Filter Press
 - Centrifuge
 - Hi-G screening
 - ▣ Geotube filter bag dewatering
- ▶ Assess Solidification Additives
 - ▣ Portland Cement and Calciment to be evaluated
 - ▣ Evaluate performance for gravity dewatered sediments and mechanically dewatered sediments
 - ▣ Assess performance for on-site reuse and off-site disposal options (strength and no free liquids)
- ▶ Assess water treatment technologies to meet discharge standards

Kemron outsourced polymer testing (see Appendix C to Attachment C) to determine the effectiveness of several polymers at forming floc to aid in the dewatering of sediments and performed the remainder of the tests in their laboratory. Where chemistry was required, samples were shipped to EnviroSystems, Inc. of Hampton, NH for analysis.

7.1 Dewatering Tests

Several dewatering tests were completed including gravity dewatering, mechanical dewatering (belt press, recessed chamber, and centrifugation), and Geotube dewatering. The Derrick Hi-G mechanical dewatering tests that were planned could not proceed because Derrick declined to accept material from the site based on the PCB concentrations. This portion of the treatability study was not performed. Treatability samples were then tested for the other dewatering methods.

7.1.1 Mechanical Dewatering

All three mechanical dewatering technologies produced acceptable dewatered sediment cake that passed the paint filter test. Based on initial test runs using polymer treated water (“Solve 137” by WaterSolve, an organic, cationic flocculant), the belt filter performed best, producing cake percent solids of 53%, as compared with 43% for the filter press and 42% for the centrifuge. For this reason, the belt filter was selected as a representative technology for use in the FFS as an appropriate dewatering technology. Filter cake generated from the belt press testing was analyzed for SPLP PCBs and metals and dewatering fluids were analyzed for PCBs and metals. Furthermore, this technology was used for subsequent evaluations involving water treatment and solidification testing. **Table C-12** presents the analytical results of the dewatering tests for the belt press.

However, it is important to note that additional follow-up tests were run for the recessed chamber filter press using non-polymer treated water at 100 psi and 125 psi and polymer treated water at 125 psi. The initial test was performed on polymer treated water at 100 psi. Results show that non-polymer treated water performed better, producing cake solids of approximately 66% for both pressures.

7.1.2 Geotube Dewatering

Geotube dewatering yielded a percent solids of 49%, passing paint filter after 24 hours of draining. This technology was considered as viable for further evaluation in the treatability testing and FFS. Dewatering fluids from the Geotube testing were evaluated pre- and post-filtration for metals and PCBs. Filter cake generated from the Geotube testing was analyzed for SPLP PCBs and metals and dewatering fluids were analyzed for PCBs and metals. **Table C-12** presents the analytical results of the dewatering tests for the Geotube fabric.

7.1.3 Water Treatment

Based on results of filtered and unfiltered samples from the belt press and Geotube simulations, both filtered (0.45 μ) and unfiltered results show exceedance for copper (4.8 μ g/L State Acute SB standard) for both technologies. Zinc exceeded the state criterion of 90 μ g/L at a concentration of 107 μ g/L in only the belt filter filtered sampled. In both simulations, a modest decrease in copper occurred when comparing unfiltered to filtered.

Regarding PCBs results, no exceedances were detected in fluids generated from Geotube dewatering. However, for the belt press, both the filtered and unfiltered samples exceeded the PCB criterion of 0.03 μ g/L for tri-, tetra-, and pentachlorobiphenyl, and total PCBs. The filtered samples showed a slight reduction in PCBs concentrations relative the unfiltered results.

These results suggest that both particulate filtration and carbon adsorption will be required for PCB and metals treatment for water generated from the belt press. Based on these results, additional water treatment tests were performed using dewatering fluids generated from the belt press simulations to determine if a finer filter size and carbon adsorption would further reduce PCBs and copper in water to be discharged.

Two additional series of tests were performed. The first test involved filtering the water at the 0.1 μ size. This was performed to determine if filtration alone would be sufficient.

In addition, carbon adsorption tests were performed on the 0.1 μ filtered water using four additive ratios of carbon to water (10g, 20g, 40g, and 80 g activated carbon per liter of water). A Calgon carbon product known as F-400 was selected for the treatability tests based upon its very high volume of micropores and ability to treat metallic ions (Hanzlik 2004). Each of these test runs was analyzed for PCBs and metals. The results are summarized in **Table C-13**.

Results show only copper exceeded CT SB surface water standards in the control sample (0.1 μ filtered and run through the same test procedure as filtered water mixed with carbon) and the baseline sample (filtered from belt press, but not run through control procedures). There were no exceedances for either PCBs or site metals in any of the other samples.

These results suggest that filtration at the 0.1 μ size is sufficient to remove particulate adsorbed PCBs, given that 0.45 μ filtration shows PCBs present in the filtered and unfiltered samples. Regarding copper, which was present in control samples at concentrations exceeding SB standards, carbon treated water reduced copper concentrations to undetectable levels (below SB standards). Filtration alone was not sufficient to reduce copper concentrations.

The second series of tests involved the same carbon addition rates; however, these tests were performed on unfiltered water to determine if PCBs could be treated without the additional filtration step at 0.1 μ . Metals were not analyzed for these tests. The results are summarized in **Table C-14**. There were no detections of PCBs in the carbon treated water or in the control samples, suggesting that filtration is not necessary to treat PCBs.

Therefore, to ensure both PCBs and copper are treated, it is recommended that water treatment include both carbon adsorption and filtration. Furthermore, a carbon product known to treat metallic ions may be effective for treatment of copper at the SAEP. Additionally, it is recommended that discussions with CT DEEP and other appropriate agencies be conducted to establish appropriate discharge criteria for discharge back to the Housatonic River, accounting for possible dilution. This may reduce the scope of treatment required.

7.2 Gravity Dewatering

For gravity dewatering, to simulate water added during mechanical dredging, approximately 15% by wet weight water was added to the sediment and mixed prior to gravity dewatering. The gravity test was run for 72 hrs at which time it was determined that the material would not pass the paint filter test. An additional test was run allowing the material to drain for 5 days. The material did not pass at 5 days. Therefore, it was concluded that the material is unlikely to drain freely in a reasonable period of time.

7.3 Solidification

To assess the potential for sediment re-use on-site and sediment solidification required for off-site disposal, a series of solidification tests were performed. Gravity dewatered sediments and filter cake from the belt press evaluations were used in these tests. Two additives were selected

for use: Portland cement and Calciment, which is a commercially available conditioning product that includes both Portland cement and lime as ingredients. It has been assumed that sediment beneficially reused onsite will likely require a minimum compressive strength; therefore, tests including the addition of Portland cement are intended to assess strength development. Solidified dewatered sediments were subjected to physical (strength) and chemical (TCLP and SPLP) testing.

7.3.1 Strength Testing

Belt press filter cakes were mixed with 3%, 6%, and 8% PC. Results after 28 days of curing showed strength development of 8.8, 108.3, and 91.3 psi, respectively, as measured using the UCS test. The results show that both the 6% and 8% mixtures will likely be sufficient for on-site beneficial re-use of sediments, given that typical specifications for strength are typically within the 25 to 100 psi for on-site use of materials, depending on the intended use, which is currently unknown.

Similarly, gravity drained sediments were tested with PC at 2%, 4%, and 5%. Results after 28 days show strength development of 5.5, 61.0, and 90.0 psi as measured using the UCS test. The results show that both the 4% and 5% mixtures will likely be sufficient for on-site use.

Although paint filter tests were not performed on the samples, solidified samples treated with PC were observed to not release any free liquids and are considered passing results.

In summary, a PC addition rate of 4% or greater will likely meet on-site reuse strength requirements. Therefore, as an assumption for this FFS given the uncertainty in the future use requirements of the site, a percentage addition rate of 6% has been selected and used for cost estimating purposes when evaluating sediments to be strengthened.

Calciment was also evaluated for off-site disposal or on-site reuse not requiring more than minimal strength. Calciment is considered generally less expensive than PC. Belt press filter cakes were mixed with 3%, 6%, and 8% Calciment. At 3%, the material does not stand up on its own and a UCS could not be performed at 8 or 28 days. For the 6% and 8% mixtures, UCS results at 28 days were 31.5 and 33.8 psi, respectively, indicating minimal strength gain, and likely acceptable for off-site disposal requirements (no free liquids).

Similarly, Calciment was added to gravity-drained sediments at ratios of 2%, 4%, and 5%. At 2%, the material does not stand up on its own and a UCS could not be performed at 8 or 28 days. In addition, the material exhibited the tendency to release free liquids, and would likely fail the paint filter. For the 4% and 5% mixtures, UCS results at 28 days were 11.5 and 18.5 psi, respectively, indicating minimal strength gain, and likely acceptable for off-site disposal requirements (no free liquids).

In summary, a minimum percentage of 4% Calciment addition is likely sufficient to condition gravity-dewatered sediments to meet paint filter requirements for off-site disposal or on-site reuse with minimal strength.

7.3.2 Leachability Testing

All solidified sediment samples were tested via the SPLP method for PCBs and site metals and via the TCLP for metals. Results are summarized in **Tables C-15** and **C-16** and show all samples passed on-site beneficial reuse criteria (**Table C-15**, SPLP results, comparison to CT pollutant mobility criteria, industrial GB criteria) and off-site RCRA characteristic testing (**Table C-16**, TCLP metals toxicity criteria). Therefore, all ratios of both additives tested would be acceptable for on-site beneficial re-use or off-site disposal. Finally, because raw sediment also passed the TCLP and SPLP standards, additives are not necessary strictly for purposed of chemical disposal criteria.

8.0 TIPPING POINT TREATABILITY STUDY

Tipping Point Resources Group, LLC has developed a proprietary mixing technology known as pneumatic flow tube mixing (PFTM) to provide an innovative technique for conveying, mixing, and placing on land solidified dredged sediments. Sediments are dredged mechanically and placed in a hopper. The material is then fed into a pneumatic conveyance pipeline and conveyed via the injection of air. The sediments moves in “plugs” with air between the plugs reducing friction, allowing efficient movement of the material. Portland cement (or other additives) can be introduced into the flow to produce a processed sediment that can be placed directly on land or into transport containers such as hopper barges. The cement is introduced as a slurry and is well mixed due to the turbulence caused by the pneumatic pumping.

This process has been used extensively in Japan to create entire new islands of high strength material for development purposes. Its use in the U.S. has been limited but is currently in the permitting process (e.g., New Haven terminal).

TPRG using a specific proprietary mixing process in bench-scale tests to assess the potential applicability of the technology and its effectiveness. The process could potentially be used to mechanical dredge sediments, convey them and simultaneously mix Portland cement into the sediments, and then place treated sediments on land as fill for beneficial reuse by the future developer.

A five-gallon bucket of sediment (an aliquot of sample SDT-XX-COMP-01) was sent to Rutgers and the material was initially characterized for physical properties (Attachment D). A range of Portland cement addition rates was then used to test the TPRG process. Cement addition rates of 6%, 8%, 12%, and 14% were tested. The purpose of these varying percentages was to develop a strength curve over a wide range of percentages given the concern over the required strength (as measured by unconfined compressive strength [UCS]) for future development activities. Results are presented in **Attachment D**.

In summary, results show excellent strength development even at the lowest cement addition ratio. The UCS results ranged from 81 to 170 psi after 28 days of curing, which is the same curing time used for the solidified samples developed by Kemron to simulate “traditional” solidification techniques. This compares favorably to typical strengths required of in situ stabilized soils or sediments that range anywhere from 25 to 100 psi as measured using the UCS test. However, even though the ultimate future use of the site is unknown, these results show that site sediments can be adequately strengthened.

To determine the leachability characteristics, both SPLP PCBs and site metals and TCLP metals were analyzed for each of the mixtures following 28 days of curing. The results were compared to state GWB leachability criteria (as measured by the SPLP) and RCRA toxicity characteristics values for metals. The results are presented in **Table C-17** for TCLP and **Table C-18** for SPLP and show acceptable leachability of the treated material, confirming that the material is suitable for on-site reuse as fill material or off-site disposal as non-RCRA waste at all of the tested percentages. The SPLP results were compared against CT RSRs Pollutant Mobility Criteria, which specify numerical concentration criteria as measured by the SPLP test for soils placed on land. The numerical values are less stringent (in general) for industrial zoned areas (GWB) such

as the Site (see <https://eregulations.ct.gov/eRegsPortal/Browse/RCSA/%7BEAD3787B-7651-4803-8239-CCD2B569E8A0%7D>).

In addition, the UCS results also show that acceptable results (71 psi) can be achieved at 6% Portland cement addition, and that therefore, a possibly lower percentage of Portland cement may be sufficient for future site use. Additional assessment of this percentage would need to be done during the design phase.

- Notes:**
Refer to Figure 4-3 for treatability testing areas 1, 4, 6, and 8.
- All treatability cores were composited together initially for each area and then together to create a single sample volume of 40 gallons to be submitted for treatability analyses and off-site waste disposal characterization parameters. Prior to combining cores from different areas, samples from each area's subcomposite were collected for geotechnical and waste characterization analysis to assess variability across the site. Five gallons of sediment were collected at Area 4 in addition to the 10 gallons collected via coring.
 - Analyses specified in text and FSP. Analytical procedures are specified in the project QAPP.
 - Synthetic Precipitation Leaching Procedure parameters include PCBs (homologs) and metals (arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), nickel (Ni), silver (Ag), zinc (Zn), mercury (Hg) only)
 - Elutriate analysis is aqueous and includes PCBs (Homologs) and metals (As, Cd, Cr, Cu, Pb, Ni, Ag, Zn, Hg only). In addition, analysis was performed on sediment and surface water pre-elutriate prep.
 - Geotechnical parameters include Atterberg limits, TOC, grain size, percent solids/moisture content, water content, bulk and dry density, specific gravity of solids.
 - 55 gallons of surface water collected at this location prior to coring, to be used for performing bench tests. Expressed water from dewatering tests used for water treatment tests.
 - Off-site waste parameters include total PCBs, TAL metals, ignitability, corrosivity, reactivity, total petroleum hydrocarbons, VOCs and TCLP metals. Four analyses run vs. one in the FSP.
 - Total petroleum hydrocarbons were added to SDT-01-COMP-001, SDT-06-COMP-003, SDT-08-COMP-001, and SDT-08-COMP-001 due to the suspected presence of fuel related contamination based on visual and olfactory evidence. In addition, SPLP VOCs and total VOCs were added to sample SDT-04-050-0002 based upon olfactory evidence.

Notes:

1. Hazardous waste parameters include TCLP metals, ignitability, corrosivity, reactivity, TAL metals, PCBs.
2. Geotechnical parameters include moisture content, bulk and dry density, specific gravity, and atterberg limits
3. Elutriate analysis is the modified elutriate. Analysis include total site metals and PCBs, filtered metals, and PCBs centrate.
4. Grain size includes hydrometer analysis.
5. Treatability testing is described in the text of Appendix A and in the report from Kemron in Attachment B.
6. TPH and SPLP/Total VOCs were run on selected samples based on the presence of odors detected during sampling and lab preparations.
7. SDT-XX-COMP-001 was composited from 3 samples (SDT-01-COMP-001, SDT-04-COMP-001, and SDT-08-COMP-001) to create a single composite (45 gallons) for treatability testing.

TCLP = Toxicity Characteristic Leaching Procedure
TAL = Target Analyte List
PCB = polychlorinated biphenyls
TPH = total petroleum hydrocarbons
SPLP = synthetic precipitation leaching procedure

Note: For samples collected on 8/22/17 and 10/19/17, results are incomplete. Hydrometer results have not yet been provided by the laboratory.

Samples were analyzed by GeoTesting: Projects 29543, 29607, and 29882

Clay and Silt results were interpolated from lab data. ASTM clay size particles are 0.005 mm or smaller and silt sized particles are 0.075 mm to 0.005 mm.

pcf = pounds per cubic foot

LL = liquid Limit; PL = plastic limit; PI = plasticity index; LI = liquidity index

USCS = United Soil Classification System; MH = silt of high plasticity; elastic silt; CH = clay of high plasticity; fat clay; SM = silty sand; ML = silt.

Sample Taken By: [Signature] Date: 8/2/17
 Checked By: [Signature] Date: 8/2/17
 Post Name: Amber Clark

QUESTION
 For the
 following

Find the
 value of
 the test
 statistic

Population
 1: $\mu = 50$
 Population
 2: $\mu = 55$
 Sample
 1: $n_1 = 30, \bar{x}_1 = 52$
 Sample
 2: $n_2 = 30, \bar{x}_2 = 54$

Assume
 $\sigma_1 = 10$
 $\sigma_2 = 12$

Test
 the
 hypothesis
 $H_0: \mu_1 = \mu_2$
 against
 $H_1: \mu_1 \neq \mu_2$

At the 5% level of significance

State the
 null and
 alternative
 hypotheses

$H_0: \mu_1 = \mu_2$
 $H_1: \mu_1 \neq \mu_2$

Write down
 the test
 statistic

$$Z = \frac{\bar{x}_1 - \bar{x}_2 - (\mu_1 - \mu_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}}$$

2

Find the
 critical
 value

Calculate the
 test statistic

$$Z = \frac{52 - 54 - (50 - 55)}{\sqrt{\frac{10^2}{30} + \frac{12^2}{30}}} = \frac{-2 + 5}{\sqrt{\frac{100}{30} + \frac{144}{30}}} = \frac{3}{\sqrt{\frac{244}{30}}} = \frac{3}{\sqrt{8.133}} = \frac{3}{2.852} = 1.052$$

Decision

Since the
 calculated
 test
 statistic
 is less than
 the critical
 value, we
 accept the
 null hypothesis

Conclusion

There is
 no
 significant
 difference
 between
 the
 means of
 the two
 populations

At the 5% level of significance

State the
 null and
 alternative
 hypotheses

$H_0: \mu_1 = \mu_2$
 $H_1: \mu_1 \neq \mu_2$

Decision

Since the
 calculated
 test
 statistic
 is greater than
 the critical
 value, we
 reject the
 null hypothesis

State the
 null and
 alternative
 hypotheses

$H_0: \mu_1 = \mu_2$

$H_1: \mu_1 > \mu_2$

$H_0: \mu_1 = \mu_2$

$H_1: \mu_1 < \mu_2$

Calculate the
 test statistic

$$Z = \frac{45 - 48 - (45 - 48)}{\sqrt{\frac{10^2}{30} + \frac{12^2}{30}}} = \frac{-3}{\sqrt{\frac{100}{30} + \frac{144}{30}}} = \frac{-3}{\sqrt{\frac{244}{30}}} = \frac{-3}{2.852} = -1.052$$

Decision

Since the
 calculated
 test
 statistic
 is less than
 the critical
 value, we
 accept the
 null hypothesis

Conclusion

There is
 no
 significant
 difference
 between
 the
 means of
 the two
 populations

Conclusion

There is
 a
 significant
 difference
 between
 the
 means of
 the two
 populations

Conclusion

There is
 no
 significant
 difference
 between
 the
 means of
 the two
 populations

Conclusion is following is given for bivariate analysis

$$r = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum (x_i - \bar{x})^2 \sum (y_i - \bar{y})^2}}$$

Sample Delivery Group Information

Sample Delivery Group Summary

Alpha Job Number : L1806872

Received : 28-FEB-2018

Reviewer : Isaac Mensah

Account Name : AMEC Foster Wheeler E & I, Inc.

Project Number : F013900990

Project Name : STRATFORD ARMY ENGINE PLANT

Delivery Information

Samples Delivered By : Express Ship
FedEx (771614079708)

Chain of Custody : Present

Cooler Information

Cooler	Seal/Seal#	Preservation	Temperature(°C)	Additional Information
A	Absent/	Ice	4.6	

Condition Information

All samples on COC received? **YES**

Extra samples received? **NO**

Are there any sample container discrepancies? **NO**

Are there any discrepancies between sample labels & COC? **YES**
L1806872-01: SDT-DS-BFT-PC03 vs. SDT-DS-BFT-PC08

Are samples in appropriate containers for requested analysis? **YES**

Are samples properly preserved for requested analysis? **YES**

Are samples within holding time for requested analysis? **YES**

All sampling equipment returned? **NA**

Volatile Organics/VPH

Reagent Water Vials Frozen by Client? **NA**

After printing this label:

1. Use the "Print" button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipment. Using a photocopy of this label for shipping purposes is the shippers' and could result in additional billing charges, along with the cancellation of your FedEx account number. Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery or misrouting, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, per current FedEx Service Guide.
