Final Focused Feasibility Study

QUALITY ASSURANCE STATEMENT

Delivery Order Title: Stratford Army Engine Plant Focused Feasibility Study

Task Order No.: 003

Wood Environment & Infrastructure Solutions, Inc. (Wood) has prepared this Focused Feasibility Study for the Stratford Army Engine Plant located in Stratford, Connecticut. The Program Manager and Project Manager have completed a technical and quality assurance review of this document for technical accuracy and completeness, in accordance with the objectives of the revised Performance Work Statement, dated January 13, 2017 and Wood's (fka Amec Foster Wheeler) Final Proposal, dated March 2, 2017.

1 EXECUTIVE SUMMARY

2 The United States Army Corps of Engineers (USACE), New England District (CENAE) with the
3 assistance of Wood Environment & Infrastructure Solutions, Inc. (Wood) has prepared this
4 Focused Feasibility Study (FFS) report to document the remedial process and identify a preferred
5 alternative for the Tidal Flats and the Outfall 008 drainage ditch for the Stratford Army Engine
6 Plant (SAEP) (the Site), in Stratford, Connecticut (**Figure 1-1**).

7 The United States Department of the Army (U.S. Army) is undertaking this FFS as part of its
8 obligations as lead agency for the Site under the Comprehensive Environmental Response,
9 Compensation, and Liability Act of 1980 (CERCLA) and Executive Order 12580. The Connecticut
10 Department of Energy and Environmental Protection (CT DEEP) is the state support agency.

11 The purpose of the FFS is to develop and evaluate remedial alternatives for the Site in accordance
12 with the requirements of CERCLA and generally follows U.S. Environmental Protection Agency
13 (USEPA) Guidance for Conducting Remedial Investigations and Feasibility Studies Under
14 CERCLA (USEPA, 1988).

15 Background

16 In October 1995, SAEP was placed on the Base Closure and Realignment (BRAC) list, known as
17 BRAC 95. U.S. Army BRAC properties must be investigated to determine the nature and extent
18 of environmental contamination. The Site has undergone various remedial investigations and
19 remedies to date. This FFS focuses on the remedial alternatives for the sediment related to the
20 tidal flats (Area of Concern 52) and the Outfall-008 (OF-008) drainage ditch (Area of Concern 25)
21 portion of the Site. These sediments have been impacted by the following:

- 22 ▶ Metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, and zinc);
- 23 ▶ Polychlorinated biphenyls; and
- 24 ▶ Polynuclear aromatic hydrocarbons (acenaphthylene, anthracene,
25 benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene,
26 benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene,
27 indeno(1,2,3-cd) pyrene, naphthalene, phenanthrene, and pyrene).

28 The FFS identifies Applicable or Relevant and Appropriate Requirements (ARARs) for the Site,
29 including location-, chemical-, and action-specific state and federal ARARs and “To be
30 Considered” (TBC) non-promulgated criteria, advisories, guidance, and proposed standards
31 issued by Federal and State governments (USEPA 1989). These ARARs were developed by
32 reviewing federal environment laws and regulations and consulting with CT DEEP to determine
33 which state laws and regulations are ARARs for this cleanup action. A critical consideration
34 resulting from these consultations is the allowable work window for dredging. A seven-month
35 dredging window has been assumed for purposes of the FFS based upon closure periods to

36 protect winter flounder and anadromous fish. The ability to expand this window to twelve months
37 will be key to completing the project in a timelier fashion.

38 **Human Health and Ecological Risk Assessments**

39 Human health and ecological risk assessments were performed for the sediment portion of the
40 Site as part of previous remedial investigations (ACSIM, 2004). The Human Health Baseline Risk
41 Assessment (HHBRA) showed risks associated with exposure to sediments in the Tidal Flats for
42 future recreational users do not exceed the CERCLA 1E-04 total cumulative cancer risk threshold,
43 or the CT DEEP cancer risk limit of 1E-05, applicable when evaluating multiple substances. Risks
44 to recreational and commercial fisherman for consumption of finfish, ribbed mussels, and/or
45 oysters taken from the Tidal Flats exceed the CT DEEP cancer risk limit of 1E-05, applicable
46 when evaluating multiple substances, due to PCB Aroclors 1248, 1254, 1260, and/or arsenic.
47 The estimated hazard index (HI) value for future recreational use (wading) at the Outfall 008
48 Drainage ditch does not exceed a value of 1 under the assumption that the total chromium
49 detected in ditch sediments is present as trivalent chromium. The Baseline Ecological Risk
50 Assessment (BERA) results indicate no unacceptable risk to macroinvertebrates, forage fish,
51 black duck, or great blue heron in the Tidal Flats; however, there is a potential risk to sandpipers
52 due to chromium in sediment and mercury (assumed to be methyl mercury) in biota. In the Outfall
53 008 drainage ditch, the BERA indicated a potential risk to macroinvertebrates in sediment due to
54 inorganics and PCB Aroclor 1260, as well as potential risk to sandpipers from chromium to
55 sandpipers, herons, and ducks if they frequently forage at this location (considered unlikely due
56 to poor habitat quality).

57 **Establishing Remedial Goals**

58 Based on the age of the sediment data (1992-1998) associated with the HHBRA and BERA, the
59 CT DEEP requested that, prior to establishment of remedial goals for sediment in the Tidal Flats
60 and Outfall 008 drainage ditch sediments, additional sediment characterization, including toxicity
61 testing, be conducted. Sediment toxicity testing and additional sediment characterization was
62 conducted by the Army in 2014 and 2015. The results of the toxicity testing indicated toxicity to
63 macroinvertebrates from sediment, in contrast to earlier BERA findings, although the toxicity could
64 not be linked to a specific chemical. As an alternative to using toxicity test results alone for
65 development of remediation endpoints, an average Effects Range Median Quotient (ERM-Q) of
66 0.5 for eight metals (arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc) has been
67 agreed to by CT DEEP to serve as a surrogate for evaluation of toxicity. The pathway to the
68 determination of remedial goals for contaminated sediments in the Tidal Flats and Outfall 008
69 drainage ditch is documented in Appendix A (see **Appendix A-1** – Final Sediment Remediation
70 Endpoints Report and **Appendix A-2** - Addendum to Final Sediment Endpoints Report), resulting
71 in the following preliminary remediation goals (PRGs):

- 72 ▶ Sample locations with an average ERM-Q value greater than or equal to 0.5 for
73 eight metals (arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc) will
74 be removed; and

75 ▶ PCB and mercury concentrations after remediation will be not substantially different
76 from those found in reference locations (0.2 mg/kg for total PCBs and 0.4 mg/kg for
77 mercury).

78 Based on those PRGs, remedial action objectives (RAOs) were established for the site according
79 to the following:

80 ▶ Tidal Flats, AOC 52: Reduce risk to the environment by reducing sediment toxicity in
81 the top 4 ft of sediment by removing sediment with average ERM-Q values of 0.5 for
82 eight Site-related metals.

83 ▶ The OF-008 Drainage Ditch AOC 25 - Reduce risk to the environment by reducing
84 sediment toxicity in the top 4 ft of sediment by removing all sediments along the entire
85 length of the OF-008 drainage ditch (inclusive of the "T" section extending to Route
86 113 to the southwest and Marine Basin to the northeast) to a depth of 4 ft below ground
87 surface.

88 Upon achieving the RAOs within the Tidal Flats, the remaining total PCBs and mercury
89 concentrations will be not substantially different from background (0.2 and 0.4 mg/kg,
90 respectively), and risks to potential future human and ecological receptors will be substantially
91 reduced. Similarly, upon achieving the RAOs for the Outfall 008 drainage ditch, risks to potential
92 future human and ecological receptors will be substantially reduced.

93 Based upon these RAOs, approximately 139,341 cubic yards (cy) would require removal within
94 the Tidal Flats, including approximately 8,854 cy of PCB impacted sediments containing greater
95 than or equal to 1.0 ppm PCBs that would be regulated under the Toxic Substances Control Act
96 (TSCA). Those sediments containing between one and less than 50 ppm (8,495 cy), while still
97 regulated under TSCA, may be disposed of in a RCRA Subtitle D landfill. For disposal of \geq 50
98 ppm PCBs, the PCB regulations authorize disposal of these wastes at TSCA-permitted disposal
99 facilities as well as at RCRA hazardous waste landfills (see 761.61(a)(5)(i)(B)(2)(iii)).
100 Approximately 359 cy of PCB impacted sediments contain 50 ppm or more PCBs. The remaining
101 130,487 cy of sediments containing PCBs at concentrations less than 1.0 ppm are potentially
102 eligible for on-site beneficial reuse. For purposes of the FFS, the volumes and related horizontal
103 and vertical delineation of the remedial footprint have been assumed to be sufficient for remedial
104 implementation based upon the sample density and number of samples previously collected to
105 support remedial footprint decisions presented in the Final Sediment Endpoints Report (Amec
106 Foster Wheeler, 2018a) and Addendum to the Final Sediment Endpoints Report (Amec Foster
107 Wheeler, 2018b). For the OF-008 drainage ditch, a total of approximately 4,900 cy of sediments
108 require remediation, consisting of 1,105 cy of PCB impacted sediments greater than or equal to
109 1.0 ppm but less than 50 ppm (TSCA-regulated and eligible for RCRA D disposal) and 3,795 cy
110 of non-TSCA sediments (eligible for on-site beneficial reuse).

111 **General Response Actions**

112 General Response Actions (GRAs) and technologies appropriate to meet the RAOs were then
113 identified and screened. Several GRAs (broad categories of technologies) were eliminated from

114 detailed consideration due to the U.S. Army's preference for removal of sediments and elimination
115 of long-term liability. Monitored Natural Recovery, containment, and in-situ treatment were all
116 eliminated as classes of technologies. Removal and other ancillary support technologies were
117 advanced to technology screening.

118 **Technology Identification and Screening**

119 The universe of potentially applicable removal technologies and related processing and support
120 technologies such as dewatering and disposal was identified and screened. All technologies were
121 evaluated against the effectiveness and implementability criteria. A qualitative assessment of
122 relative cost was developed. A conclusion was then drawn regarding each technology each of
123 which was then either eliminated from further consideration or retained for inclusion in the Tidal
124 Flats and/or Outfall 008 drainage ditch alternatives.

125 A detailed technology screening of dredging technologies was performed and included the
126 evaluation of hydraulic dredging, mechanical dredging, mechanical dredging with hydraulic
127 transport, pneumatic flow tube mixing (combination of mechanical dredging and pneumatic
128 transport with the introduction of processing additives, amphibious dredging (versatile dredging
129 equipment that can work in a variety of water depth and sediment conditions), and conventional
130 removal with a terrestrial long-stick excavator. All options were carried forward into alternatives
131 development. A detailed dredging alternatives evaluation report is included in the Appendices to
132 this report. All mechanical dredging discussed in this FFS refers to dredging equipment that
133 utilizes precision level cut sealed environmental dredging buckets and GPS positioning software
134 to ensure accurate removals with low potential for resuspension and residuals generation.

135 Other key aspects of the technology screening included the evaluation of dewatering technologies
136 which include: gravity dewatering, stabilization and solidification, belt filter press dewatering,
137 recess chamber filter press, centrifuge, pneumatic flow tube mixing, and several other proprietary
138 dewatering systems (e.g., Hi-G, Genesis).

139 Disposal technologies evaluated included: confined aquatic disposal (CAD), confined disposal
140 facility (CDF), on-site beneficial reuse, and off-site disposal or reuse.

141 **Treatability Testing**

142 Throughout the technology and alternatives identification and screening process, treatability
143 testing was conducted to evaluate several sediment processing technologies, including
144 dewatering, solidification, and water treatment. Representative samples from several areas of the
145 site were collected to develop a treatability composite sediment sample. Other supporting sample
146 collection and analysis was conducted including modified elutriate, geotechnical evaluations,
147 leaching tests relevant to on- and off-site disposal, waste characterization analysis, and
148 evaluation of residuals from dewatering and solidification treatability testing.

149 Several dewatering options were evaluated including gravity, belt filter press, recessed chamber,
150 centrifuge, and Geotube dewatering. All dewatering technologies evaluated as part of this FFS

151 were successful at producing a sediment which passed the paint filter test except for gravity
152 dewatering. The belt filter press simulation produced sediment cake with the highest percent
153 solids (53%, passing paint filter) when compared with the other mechanical dewatering
154 technologies (centrifuge and recessed chamber) using a simulated dredge slurry treated with a
155 cationic organic polymer (Solve 137). Additional tests on untreated (no polymer added) slurry
156 yield higher results for the recessed chamber (66%); however, belt press was selected for
157 inclusion the FFS to represent mechanical dewatering technologies. Two additives were
158 evaluated for solidification of sediments generated from the belt press and gravity dewatering:
159 Portland cement and Calciment. Solidification results show excellent strength gain of sediment
160 with Portland cement, and very modest or no strength gain with Calciment. The lowest additive
161 ratio tested for Calciment added to gravity-dewatered sediments did not produce sediments that
162 would pass the paint filter test. Based on the solidification test results, for purposes of the FFS it
163 has been assumed that an addition rate of 6% Portland cement is appropriate for mechanically
164 dredged sediments that are gravity drained. Additional solidification tests performed to simulate
165 pneumatic flow tube mixing (PFTM) also showed excellent strength gain for all percentages tests
166 (6% up to 14%). Therefore, for purposes of this FFS, an addition rate of 6% Portland cement has
167 been selected for addition to sediments processed via PFTM technology to eliminate free
168 moisture and develop strength. No additives are proposed for sediments dewatered via either belt
169 press or Geotube because those methods produced sediments passing the paint filter test (no
170 free liquids)

171 In addition, leaching tests performed on solidified sediments (for both Portland cement and
172 Calciment additives) show materials pass on-site placement criteria (GWB Synthetic Precipitation
173 Leaching Procedure [SPLP] standards under the CT Remediation Standard Regulations [RSRs])
174 and off-site disposal (Toxicity Characteristic Leaching Procedure [TCLP] analysis for RCRA
175 toxicity). In addition, untreated sediments also pass both SPLP and TCLP derived criteria for on-
176 and off-site reuse/disposal. These results provide data to support the option to beneficially reuse
177 solidified or non-solidified sediment on the site as potential future fill material.

178 Initial results of dewatering fluid testing (0.45 micron (μ)) filtered and unfiltered fluids were
179 analyzed) suggested that PCBs and copper may be present in the total and dissolved phases at
180 concentrations exceeding state chronic saltwater criteria. These results suggested that filtration
181 for particulate removal and carbon adsorption may be required to remove PCBs and additional
182 steps for dissolved metals could potentially be required. Subsequent testing was then performed
183 on belt press generated dewatering fluids to determine if a finer filter size and carbon adsorption
184 would further reduce PCBs and copper in water to be discharged. A series of tests were performed
185 on unfiltered and 0.1 μ filtered water from the belt press in which a control sample was analyzed
186 and four additional samples with different amounts of activated carbon were added. Results show
187 only copper exceeded CT SB surface water standards in the control samples (0.1 μ filtered). There
188 were no exceedances for either PCBs or site metals in any of the other samples.

189 These results suggest that filtration at the 0.1 μ size is sufficient to remove particulate adsorbed
190 PCBs and that PCBs may not be truly dissolved, given that 0.45 μ filtration shows PCBs present.
191 Furthermore, because PCBs were not detectable above reporting limits in control samples,

192 filtration alone may be sufficient to reduce PCB concentrations to below SB standards. Regarding
193 copper, which was present in control samples at concentrations exceeding SB standards, carbon
194 reduced copper concentrations in dewatering fluids to undetectable levels (below SB standards)
195 using an activated carbon type specially manufactured to remove metallic ions. Therefore, to
196 ensure both PCBs and copper are treated, it is recommended that water treatment include both
197 carbon adsorption and filtration. Additionally, it is recommended that additional discussions with
198 CT DEEP and other appropriate agencies be conducted to establish appropriate discharge criteria
199 for discharge return to the Housatonic River or other indirect discharges to the Stratford Waste
200 Water Treatment Plant (WWTP) if required, accounting for possible dilution. The Engineer
201 Research and Development Center (ERDC) will be conducting dilution modeling to support the
202 analysis and decision for an appropriate dilution factor which may reduce the scope or cost of
203 treatment required.

204 **Alternatives Development and Screening**

205 Eleven alternatives were developed for the Tidal Flats and three alternatives were developed for
206 the OF-008 drainage ditch to provide a wide range of options for the site, with each set including
207 a No Action Alternative. All alternatives were evaluated against the effectiveness,
208 implementability, and cost criteria for screening purposes. For the Tidal Flats, the No Action
209 Alternative (Alternative 1), two alternatives including a sheet pile cofferdam to isolate the dredge
210 area (Alternatives 7 and 8), Amphibious Dredging (Alternative 9), a shoreline CDF alternative for
211 disposal of sediments (Alternative 10), and two CAD cell options (within the Tidal Flats and within
212 the Housatonic River, Alternative 11) were eliminated from further consideration.

213 The No Action alternative was eliminated due to the requirement to remove sediments. The sheet
214 pile cofferdam options (Alternatives 7 and 8) were eliminated due to the high cost of installing the
215 cofferdam, the extended schedule to design and install the cofferdam, and other technical
216 complexities related to its location adjacent to an existing breakwater and within contaminated
217 areas on the site. Amphibious Dredging (Alternative 9) was dropped from further consideration
218 due to its high potential for generating residuals and resuspended sediments. Alternative 10
219 (shoreline CDF) was eliminated from further consideration due to its very high cost to install an
220 adequately stable sheet pile wall and the building demolition that would be needed to
221 accommodate space for sediments behind the CDF. Alternative 10 would also not provide any
222 improvement in effectiveness and would be more difficult to implement than other alternatives.
223 Alternative 11 (CAD) was eliminated from further consideration due to the need for sheet pile
224 walls (at tidal flats location), sediment re-handling, the need for an additional geotechnical
225 investigation, and requirement to stockpile excess sediments on land.

226 Alternatives 2, 3, 4, 5, and 6 were retained for detailed evaluation. These alternatives include
227 various combinations of mechanical and hydraulic dredging; mechanical, hydraulic, and
228 pneumatic transfer of sediments; gravity dewatering, belt filter press dewatering, and Geotube
229 dewatering; solidification; and on-site beneficial reuse or off-site disposal. **Table ES-1**
230 summarizes these options.

231 For OF-008 three alternatives were developed, including No Action (Alternative 1), Excavation,
232 (Alternative 2) and Mechanical Dredging (Alternative 3). The No Action alternative and
233 Mechanical Dredging were eliminated from further consideration, due to the requirement for
234 removal at the site (No Action) and the lack of effectiveness expected from mechanical dredging
235 in the drainage ditch. Alternative 2, Excavation, was carried forward into the detailed evaluation.

236 **Detailed Evaluation of Alternatives**

237 For purposes of the detailed evaluation, each of the five remedial alternatives for the Tidal Flats
238 was combined with the single alternative for OF-008 to provide complete Site wide alternatives
239 for remediation of the sediments. The following five alternatives (see **Table ES-1** for a summary
240 of the Tidal Flats components) were carried forward into detailed analysis:

- 241 ▶ Alternative 2: Hydraulic Dredging and Transport, Filter Press or Geotube Dewater, On-
242 Site Beneficial Reuse or Off-Site Disposal

- 243 ▶ Tidal Flats: Hydraulic dredge to hydraulic off-load and filter press dewater with
244 mechanical backfill for restoration and on-site beneficial reuse or off-site disposal

- 245 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport to
246 sediment processing area and on-site beneficial reuse or off-site disposal. Mechanical
247 backfill and restoration.

- 248 ▶ Alternative 3: Mechanical Dredging and Transport, Dewater, Solidify, On-Site Beneficial
249 Reuse or Off-Site Disposal

- 250 ▶ Tidal Flats: Precision mechanical dredging to mechanical off-load, dewater and
251 solidify, with mechanical backfill for restoration and on-site beneficial reuse or off-site
252 disposal

- 253 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport to
254 sediment processing area and on-site beneficial reuse or off-site disposal. Mechanical
255 backfill and restoration.

- 256 ▶ Alternative 4: Mechanical Dredging with Hydraulic Transport, Belt Press or Geotube
257 Dewater, On-Site Beneficial Reuse or Off-Site Disposal

- 258 ▶ Tidal Flats: Precision mechanical dredging to hydraulic offload and filter press dewater
259 with mechanical backfill for restoration and on-site beneficial reuse or off-site disposal.

- 260 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport to
261 sediment processing area and on-site beneficial reuse or off-site disposal. Mechanical
262 backfill and restoration.

- 263 ▶ Alternative 5: Mechanical Dredging with Pneumatic Flow Tube Mixing Transport and
264 Dewater, On-Site Beneficial Reuse

265 ▶ Tidal Flats: Precision mechanical dredging to pneumatic flow tube mixing with
266 mechanical backfill for restoration and on-site beneficial reuse

267 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport to
268 sediment processing area and on-site beneficial reuse. Mechanical backfill and
269 restoration.

270 ▶ Alternative 6: Mechanical Dredging, Off-Site Transport, Process and Disposal

271 ▶ Tidal Flats: Precision mechanical dredging to barge off-site for processing (Clean
272 Earth or Tipping Point) with mechanical backfill for restoration and off-site disposal.

273 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport to on-
274 site sediment processing area and off-site disposal. Mechanical backfill and
275 restoration.

276 Table ES-1 summarizes the components of each remedial alternative for the Tidal Flats remedial
277 area and the disposal and dewatering options as described above. For costing purposes each of
278 alternatives 2 through 4 include the following:

279 • An on-site beneficial re-use option for sediments containing less than 1.0 mg/kg PCBs
280 coupled with off-site disposal for all other sediments at appropriate RCRA-D and TSCA
281 facilities; and

282 • An off-site disposal option (assuming no on-site beneficial reuse) for all sediments at
283 appropriate RCRA-D and TSCA facilities.

284 Alternative 5 (solidification through the PFTM process) includes only on-site beneficial reuse of
285 sediments containing less than 1.0 mg/kg PCBs and off-site disposal of sediments exceeding
286 PCB concentrations of 1.0 mg/kg. Alternative 6 does not include an on-site beneficial re-use
287 option and only considers off-site disposal of all sediments via barge transport and off-site
288 processing and disposal. Alternatives 2 and 4 also include dewatering options for the use of
289 either a belt filter press or Geotubes, as these technologies were successful at producing
290 dewatered sediment which passed the paint filter test.

291 Each of the five alternatives were described in detail and then evaluated against seven of the nine
292 CERCLA FS criteria, including Overall Protection of Human Health and the Environment,
293 Compliance with ARARs, Long-term Effectiveness, Short-term Effectiveness, Reduction of
294 Toxicity, Mobility, or Volume through Treatment, Implementability, and Cost and Region I and CT-
295 specific Sustainability criteria. The two remaining criteria, State and Community Acceptance, will
296 be evaluated following public and state review of the Proposed Plan and documented in the
297 Responsiveness Summary within the Decision Document. Cost evaluations include the
298 development of capital costs, operations, maintenance, and monitoring costs (OMM), total costs,
299 and total present worth costs.

300 **Comparative Analysis**

301 A comparative analysis was then conducted to identify the balancing factors to aid in selection of
302 a preferred remedy. Based on this evaluation, all alternatives would meet the threshold criteria of
303 Overall Protection of Human Health and the Environment and Compliance with ARARs, and there
304 are no substantive differences with respect to these criteria among the alternatives. Each of these
305 alternatives would adequately remove sediments to meet RAOs (providing protection to human
306 health and the environment) and the work would be performed in compliance with ARARs.

307 The remaining criteria are known as the “primary balancing” criteria. The evaluations are
308 summarized as follows:

309 **Long-term Effectiveness.** Each of the alternatives would permanently remove sediments from
310 Tidal Flats and OF-008, and place backfill materials to reestablish habitat. There is essentially no
311 difference between alternatives with respect to this criterion. Following remediation, ecological
312 risks would be addressed in the tidal flats and the Outfall 008 drainage ditch, with no sediments
313 remaining within these areas exceeding site PRGs. Any site contaminants remaining would be at
314 concentrations that do not cause exceedance of the ERM-Q of 0.5, and below 0.40 mg/kg Hg and
315 0.2 mg/kg PCBs (PCBs and Hg are co-located with the other eight targeted inorganics and are
316 therefore not driving the remediation footprint).

317 However, when comparing options for on-site re-use and off-site disposal, off-site disposal has
318 more permanence because the material would be placed in a secure offsite landfill facility rather
319 than placed on-site. For placement of contaminated sediments on land, the State of CT does not
320 have regulations that are directly applicable; however, through dewatering and processing of the
321 removed sediments, the material will be rendered soil-like and as such, the “polluted soil”
322 regulations¹ are relevant and appropriate to the placement and beneficial re-use of site sediments
323 at the site. The polluted soil regulations require certain conditions to be met prior to placement of
324 contaminated materials (RSRs Section 22a-133k-1(h)) on land – these conditions would be met
325 including placement above the water table and documenting the location of the polluted soil with
326 the Commissioner; however, under CT RSRs it is uncertain if the material would be considered
327 “inaccessible soil” or “environmentally isolated” because the exact location for placement has not
328 yet been determined, and ultimately must be consistent with the future developer’s plans.
329 Therefore, the adequacy and reliability of the engineering controls to be used to ensure future
330 isolation of the contaminated materials is uncertain until a full development plan is available.

331 Furthermore, on-site options that do not include solidification, Alternatives 2 and 4, which rely on
332 mechanical dewatering methods or Geotubes, do not require the addition of additives for
333 placement on site. In this respect, the remediation may not be permanent because future
334 solidification may be required to meet future reuse criteria with respect to strength, which are
335 currently unknown.

¹ The “polluted soil” definition (Remediation Standard Regulations Section 22a-133k-1(a)(50) includes soil that is affected by a release of a substance at concentrations above the analytical detection limit for that substance; however, the definitions of soil and sediment are mutually exclusive, and no analogous definition is provided for sediment.

336 **Reduction of Toxicity, Mobility, and Volume through Treatment.** None of the alternatives
337 have treatment as a principle element to permanently and significantly reduce toxicity, mobility,
338 or volume of the hazardous substances. However, all alternatives include some form of treatment
339 to process dredged material or treat dewatering fluids. Alternatives that involve hydraulic
340 transport of sediment significantly increase the volume of materials requiring
341 processing/treatment due to the large volume of water entrained to move sediments in a slurry.
342 Alternative 2 is evaluated least favorably, followed by Alternative 4, and then the remaining
343 alternatives. Alternatives that involve the addition of additives to sediments increase the volume
344 of materials, which is viewed negatively under this criterion. This includes any process involving
345 mechanical dredging due to the need for additives (e.g., Portland cement) to reduce free water.
346 However, this volume increase is modest relative to the volume of water entrained in hydraulic
347 transport options. Mechanical dredging options generate a lower volume of dredged materials
348 than hydraulic dredging options due to the high level of precision of the level cut bucket proposed.

349 **Short Term Effectiveness.** The main differentiating factor under this criterion is time to achieve
350 RAOs. Alternatives that include mechanical dredging and mechanical transport (Alternatives 3, 5,
351 and 6) have the highest dredging productivity and therefore the shortest overall schedule and are
352 evaluated more highly in this regard. Mechanical dredging with hydraulic transport (Alternative 4)
353 has a slightly longer schedule due to the more complex slurry component required to transport
354 sediment to land. Alternative 2 (Hydraulic dredging) would have the longest overall schedule and
355 therefore is evaluated least favorably.

356 An additional consideration is release of suspended sediments, which has the potential to impact
357 downstream ecological receptors. All mechanical and hydraulic dredging alternatives will cause
358 release and resuspension to some degree as affected by the necessary operational processes;
359 for example, at the cutter head or bucket, tug and support vessel propwash, anchor management,
360 pipeline back flushing, and impacts with the bed. In most cases these release mechanisms can
361 be managed by selecting appropriately sized and configured equipment, conducting operations
362 in a manner that avoids or minimizes release, and mitigated by installing proper engineering
363 controls. Properly installed and maintained turbidity curtain systems coupled with a properly
364 implemented turbidity monitoring, maintenance, and management program would be one such
365 engineering control that can substantially contain resuspension.

366 **Implementability.** Generally, the dredging technologies selected (mechanical and hydraulic) are
367 widely available and proven and evaluated similarly for implementability. Alternatives 2
368 (hydraulic), 3 (mechanical), and 6 (mechanical/off-site processing and disposal) are all evaluated
369 similarly with respect to implementability for the sediment portions of the alternatives. Alternatives
370 3 and 5 rely upon innovative technologies (mechanical dredging with hydraulic transport) or
371 technologies that are not widely used (PFTM) and are therefore considered more difficult to
372 implement given the scarcity of contractors able to perform the work. Alternatives that rely on
373 significant water treatment systems (Alternatives 2 and 4) are considered more difficult to
374 implement given the additional complexity of mobilizing and operating large dewatering and water
375 treatment systems. Alternative 5 (PFTM) has the added advantage of very little or no water
376 treatment required for non-TSCA sediments. In addition, the Geotube option is evaluated more

377 favorably over the mechanical dewatering option (belt press) based on its simpler operation.
378 However, both the belt filter press and Geotube options require a larger footprint relative to
379 alternatives that rely on gravity dewatering, complicating site logistics, particularly when
380 considering on-site placement of fill materials.

381 **Cost.** Both on-site beneficial reuse and off-site disposal were evaluated. For on-site reuse,
382 Alternative 3, Mechanical Dredging and Alternative 4, Hybrid Dredging (Geotubes) have the
383 lowest estimated costs at \$79.4M and \$78.4M, respectively. For off-site disposal, Alternative 6
384 (off-site disposal via barge) had the lowest overall cost (\$93.5M). Figure ES-1 presents the total
385 cost for each alternative (with both on-site beneficial reuse and off-site disposal options). Figure
386 ES-1 also includes lines indicating the -30% cost line and +50% cost line for each option. These
387 lines depict graphically the CERCLA-defined cost accuracy range of -30%/+50%. The two lines
388 for on-site re-use options and the two lines for the off-site disposal options illustrate that all
389 remedial alternative costs fall within the CERCLA range of FS accuracy as defined by the
390 alternatives analyzed, indicating that differences in cost among the alternatives are generally not
391 significant given the current stage of project definition.

392 **Preferred Remedy**

393 Based upon the detailed and comparative analyses, the preferred remedy is Alternative 3,
394 Mechanical Dredging for on-site beneficial reuse of sediments. This option has the highest
395 anticipated productivity rates (and therefore shortest overall schedule) and would generate a
396 smaller volume of dredged material than hydraulic dredging based on the precision mechanical
397 dredging bucket proposed. In addition, this option would generate a significantly lower volume of
398 water relative to hydraulic dredging or hydraulic transport options (Alternative 2 and 4). A
399 precision low turbidity level cut environmental clamshell bucket would be used to minimize over-
400 dredge and the generation of resuspended sediments. As with any of the alternatives,
401 resuspended sediments can be adequately controlled through a properly implemented turbidity
402 monitoring, management, and engineering controls program via silt curtain or other appropriate
403 technology and proper selection of equipment by an experienced dredging contractor. The use of
404 a precision low turbidity level cut environmental clamshell bucket results in a reduction of volume
405 of dredged materials relative to hydraulic dredging options based upon its accuracy. In addition,
406 this type of bucket will result in less mixing of underlying clean sediments relative to hydraulic
407 dredging. Mechanical dredging systems are more easily converted to capping barges, which
408 reduces costs. Mechanically dredged and conveyed materials will require cement solidification
409 because gravity drainage alone will not reduce free liquids sufficiently; however, this is a standard
410 element of dredged material processing and not difficult to incorporate. In addition, Alternative 2
411 and 4 do not include Portland cement, so an additional cost for solidification would be realized to
412 ultimately meet on-site strength requirements for beneficial reuse.

413 In summary, when on-site beneficial re-use is considered, Alternative 3 would meet the threshold
414 criteria and provides the best performance relative to the balancing criteria. Alternative 3 would
415 provide benefits comparable to or better than all other on-site reuse options while achieving this

416 at a low overall cost using the proven and accurate technologies that achieve results quickest
417 with the lowest overall environmental impacts.

418 If off-site disposal of all sediments is required, Alternative 6 (Mechanical Dredging and Off-site
419 Disposal via Barge) would achieve the same benefits with respect to dredging activities as
420 Alternative 3 (Mechanical Dredging) but would achieve those results at the lowest cost relative to
421 other options that couple dredging with off-site disposal via truck. In addition, because all tidal
422 flats work would be managed from the water, Alternative 6 would have essentially no on-site
423 footprint, except for a limited area to support the Outfall 008 work including material processing
424 and transport. The limited on-site footprint would provide a significant benefit for the schedule of
425 on-site development by allowing dredging and site development work to continue simultaneously.

Figure ES-1
Remedial Alternative Cost Comparison Chart

- Total with Escalation - On-Site Beneficial Reuse (2022 Capital Cost)
- Total with Escalation - Off-Site Disposal Option (2022 Capital Cost)
- On-Site Cost -30%
- On-Site Cost +50%
- Off-Site Cost -30%
- Off-Site Cost +50%

**Table ES-1
Alternative Summary
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

Alternative	Dredge Method	Transport	Dewater Method	PCB < 1.0 mg/kg	1.0 mg/kg ≤ PCB < 50 mg/kg	50 mg/kg ≤ PCB
Alternative 2 Hydraulic Dredge to Hydraulic Transport with Dewatering: Belt Press or Geotubes	Hydraulic	Hydraulic	Belt Filter	On-Site Beneficial Reuse or Off-Site Disposal at RCRA D Facility	Off-Site Disposal at RCRD D Facility	Off-Site Disposal at TSCA Permitted Facility
			Geotube			
Alternative 3 Mechanical Dredge to Mechanical Transport with Solidification (Portland Cement)	Mechanical	Mechanical	Gravity and Solidification	On-Site Beneficial Reuse or Off-Site Disposal at RCRA D Facility	Off-Site Disposal at RCRD D Facility	Off-Site Disposal at TSCA Permitted Facility
Alternative 4 Mechanical Dredge to Hydraulic Transport with Dewatering: Belt Press or Geotubes	Mechanical	Hydraulic	Belt Filter	On-Site Beneficial Reuse or Off-Site Disposal at RCRA D Facility	Off-Site Disposal at RCRD D Facility	Off-Site Disposal at TSCA Permitted Facility
			Geotube			
Alternative 5 Mechanical Dredge to PFTM Transport and Solidification (Non-TSCA) and Barge Transport (TSCA)	Mechanical	PFTM (on-site) Barge (off-site)	Gravity and PFTM Solidification	On-Site Beneficial Reuse or Off-Site Disposal at RCRA D Facility	Off-Site Disposal at RCRD D Facility	Off-Site Disposal at TSCA Permitted Facility
Alternative 6 Mechanical Dredge to Mechanical Transport for Off-Site Process/Disposal (All)	Mechanical	Barge	Gravity and Off-Site Solidification	On-Site Beneficial Reuse or Off-Site Disposal at RCRA D Facility	Off-Site Disposal at RCRD D Facility	Off-Site Disposal at TSCA Permitted Facility

Notes:

PFTM = Pneumatic Flow Tube Mixing; TSCA = Toxic Substance Control Act

426 **1.0 INTRODUCTION**

427 The United States Army Corps of Engineers (USACE), New England District (CENAE) with the
428 assistance of Wood Environment & Infrastructure Solutions, Inc. (Wood) has prepared this
429 Focused Feasibility Study (FFS) report to document the remedial process and select a remedial
430 alternative for dredging of sediments in the Tidal Flats and the Outfall-008 (OF-008) drainage
431 ditch (the Site) at the Stratford Army Engine Plant (SAEP), in Stratford, Connecticut (**Figure 1-1**).

432 The United States Department of the Army (U.S. Army) is undertaking this FFS as part of its
433 obligations as lead agency for the Site under the Comprehensive Environmental Response,
434 Compensation, and Liability Act of 1980 (CERCLA) and Executive Order 12580. The Connecticut
435 Department of Energy and Environmental Protection (CT DEEP) is the state support agency.

436 The Tidal Flats and OF-008 define the Site as discussed in this FFS, the remainder of the SAEP
437 is regulated under a Resource Conservation and Recovery Act (RCRA) Stewardship Permit and
438 will be addressed under separate action(s).

439 **1.1 Purpose and Organization of Report**

440 The purpose of the FFS is to develop and evaluate remedial alternatives for the Site in accordance
441 with the requirements of the CERCLA and follows U.S. Environmental Protection Agency
442 (USEPA) Guidance for Conducting Remedial Investigations and Feasibility Studies Under
443 CERCLA (USEPA, 1988).

444 The FFS report is based on the nature and distribution of contaminants, human-health and
445 ecological risk assessments, derivation of the effects range median quotient (ERM-Q) and use of
446 the ERM-Q value of 0.5 to define the proposed areas to be remediated (Amec Foster Wheeler,
447 2018a). The report consists of the following seven sections:

448 Section 1.0 introduces the FFS report and its purpose. Section 1.0 briefly describes the FFS
449 process to enhance the reader's understanding when reviewing relevant sections of the report
450 and includes a brief background description of the SAEP including site location and facility history.
451 Previous remedial investigations (RI) are summarized in the Sediment Remediation Endpoints
452 Report (Amec Foster Wheeler, 2018a) which is included as **Appendix A-1**. Section 1.0 also
453 summarizes site characteristics associated with the Tidal Flats and OF-008, the contamination
454 assessment for Area of Concern (AOC)-52 Tidal Flats and AOC-25 OF-008 drainage ditch, and
455 work with the CT DEEP to develop remedial goals based on multiple site-related chemicals in
456 comparison to background concentrations in the Housatonic River sediment. Section 1.0 also
457 presents a site conceptual model that considers the interrelationships of contaminant source
458 areas, site geology, site hydrogeology, contaminant persistence, and contaminant distribution.

459 Section 2.0 identifies the basis for remediation. This section links the results of the risk
460 assessments to the selection of remedial technologies by identifying remedial response objectives
461 and preliminary remediation goals (PRGs), developing remedial action objectives (RAOs), and
462 listing the resultant general response actions (GRAs). This section initiates the risk-management
463 decision process and presents Applicable or Relevant and Appropriate Requirements (ARARs)

464 for the project including location-, chemical-, and action-specific state and federal ARARs and “To
465 be Considered” (TBC) non-promulgated criteria, advisories, guidance, and proposed standards
466 issued by Federal and State governments (USEPA 1989).

467 Section 3.0 identifies and screens remedial technologies for the corresponding GRAs.

468 Section 4.0 describes the assembly of these technologies into remedial alternatives, and screens
469 them against the criteria of implementability, effectiveness, and cost.

470 Section 5.0 presents the detailed evaluation of the retained remedial alternatives. Detailed
471 descriptions of the components of each alternative and an evaluation of each alternative against
472 the first seven evaluation criteria (Overall Protection of Human Health and Environment,
473 Compliance with ARARs, Long-term Effectiveness, Reduction of Toxicity, Mobility, and Volume
474 through Treatment, Implementability, and Cost) listed in the National Oil and Hazardous
475 Substances Contingency Plan (NCP) (USEPA, 1990) are presented.

476 Section 6.0 presents the comparative analysis of the retained alternatives with respect to
477 CERCLA guidance highlighting relative advantages and disadvantages of, and differences
478 between, the alternatives with respect to the seven evaluation criteria.

479 Section 7.0 presents the preferred alternative selected based on the comparative analysis and a
480 four-point ranking system for each of the seven criteria. The tradeoffs between the alternatives
481 and how the scoring was developed are described.

482 Section 8.0 presents the historic documents and references cited in the text of this FFS.

483 Figures, Tables, and Appendices are presented following Section 8.

484 **1.2 Background**

485 The former SAEP is located at 550 Main Street in Stratford, Connecticut. This FFS is solely
486 focused on the Tidal Flat area (AOC-52) located between the SAEP and the Housatonic River
487 channel, and the OF-008 drainage ditch (AOC-25) (**Figure 1-2**) which are being remediated under
488 CERCLA and DERP. The remainder of the Site is regulated under RCRA Stewardship permit.
489 Compliance work performed under the Stewardship Permit is a separate, future action.

490 The property was developed in 1927 for Sikorsky Aircraft where aircraft and engines were
491 manufactured from 1929 to 1948. The plant was expanded during World War II to accommodate
492 mass production of the F4U Corsair fighter plane. During this time the shoreline was extended to
493 provide land area for new buildings. The plant was idle from 1948 until 1951. From 1952 until it
494 closed in 1997, the plant was used to produce reciprocating aircraft engines and turbine engines
495 for both commercial and military applications.

496 Process wastes generated on-site included waste oils, fuels, solvents, and paints. An on-site
497 chemical waste treatment plant operated to treat waste generated at the facility and released

498 effluent to the Housatonic River under a National Pollutant Discharge Elimination System
499 (NPDES) permit. Waste lagoons on the Site were regulated and evaluated under RCRA in the
500 1980s. The facility was cited in 1983 for violating the Toxic Substances Control Act (TSCA)
501 regarding reporting of polychlorinated biphenyl (PCB)-containing transformers. The Site was
502 owned by the United States (U.S.) Air Force until 1976, when ownership was transferred to the
503 U.S. Army (USEPA, 2016).

504 All manufacturing operations at the facility have ceased, and some office space is currently
505 utilized for site security and building maintenance.

506 **1.2.1 Site Description**

507 The SAEP is located on the Stratford Point peninsula in the southeast corner of Fairfield County.
508 The Site is on the border of the Bridgeport and Milford U.S. Geological Survey (USGS)
509 Quadrangles. Latitudinal and longitudinal coordinates of the SAEP are approximately 41° 10'
510 North and 73° 07' West. The location of the SAEP is shown on **Figure 1-1**.

511 SAEP consists of approximately 124 acres, of which about 76 acres are improved land, and the
512 Army has riparian rights (access) to approximately 48 acres of adjacent tidally influenced
513 property bordering the Housatonic River. All tidal lands below the mean high-water line are
514 owned by the State of Connecticut as public trust land. The 76 acres of improved land contain
515 49 buildings, paved roadway and grounds, and five paved parking lots. The 48 acres of tidally
516 influenced property adjacent to the Housatonic River are known as the "Tidal Flats". An area
517 map is provided as **Figure 1-2**.

518 The SAEP has a long industrial history and was used to develop, test, and manufacture aircraft,
519 aircraft engines, and other aerospace products for 68 years. The plant closed in 1997. Access
520 to the Site is restricted by perimeter fencing and security personnel. The SAEP Site is bordered
521 by a paved parking lot and wetlands to the north; the Tidal Flats and Housatonic River to the
522 east; an open field, a drainage channel, and small businesses to the south; and hangar
523 buildings, the Sikorsky Memorial Airport, several small businesses, and Frash Pond to the west.
524 Land near the Site is zoned light industrial, business, commercial, or residential. There are
525 several businesses located west of Main Street across from SAEP, including a small strip mall,
526 service stations, and a restaurant.

527 Nearby recreational areas include Short Beach Park ½-mile to the southeast, and public wildlife
528 areas, including Nells Island and the Great Meadow Salt Marsh across the Housatonic River
529 from SAEP.

530 **1.2.2 Site History**

531 As part of the 2004 RI Report (ACSIM, 2004), the Site was organized into almost 70 AOCs. These
532 AOCs were then consolidated into groups according to the type and location of each. These AOC
533 groups were identified to include:

- 534 ▶ Hazardous Waste Storage Area
- 535 ▶ Chemical Waste Treatment System
- 536 ▶ Manufacturing, Testing, Research and Development Area
- 537 ▶ Stormwater and Wastewater System
- 538 ▶ Miscellaneous Areas

539 From the list above, three primary AOCs are further discussed below and are the primary focus
540 of this FFS.

- 541 ▶ Chemical Waste Treatment System (CWTS)
- 542 ▶ AOC 25 (Outfall-008 and Drainage Ditch)
- 543 ▶ Stormwater and Wastewater System
- 544 ▶ AOC 24 (Discharge to the Housatonic River at Outfall-007)
- 545 ▶ AOC 52 (Outfalls-001 through -006 and the Tidal Flats)

546 For the purposes of this report, AOCs 24 and 52 are combined to represent the Tidal Flats
547 sediments.

548 **1.2.2.1 AOC 24: Discharge to the Housatonic River at Outfall-007**

549 Treated stormwater from the oil abatement treatment plant (OATP) had discharged through
550 Outfall-007 (OF-007) to the Tidal Flats of the Housatonic River (**Figure 1-3**). The OATP received
551 and treated stormwater and dry weather flow, including the first flush of stormwater, from the six
552 storm pump stations. Industrial wastewater discharged to the OATP included boiler blowdown,
553 cooling water, laboratory wastes, photographic processing wastes, paint-contaminated
554 wastewater, soluble and insoluble cutting oils, spent hydraulic fluid, penetrant dyes, brine, and
555 emulsion cleaning detergents (ESE, 1981; W-C, 1991).

556 Four chemical releases to the Tidal Flats have been documented. These releases involved:

- 557 ▶ In May 1978, a spill of 25 to 30 pounds of chromic acid was discharged into the OATP
558 and into the river via OF-007 (W-C, 1991).
- 559 ▶ In August 1978, Connecticut Department of Environment Protection (CTDEP) was
560 advised that a yellow plume of hexavalent chromium was extending approximately 200
561 yards from OF-007 (CDM FPC, 1992). This release occurred during a period when it
562 is suspected that effluent from the CWTS was routed to the OATP for discharge via
563 OF-007.
- 564 ▶ Approximately 75 gallons of oil sludge from the OATP bypassed clogged skimmers
565 and discharged from OF-007 in July 1979 (W-C, 1991).
- 566 ▶ In October 1981, approximately 20 gallons of “Zyglo,” a fluorescent metal penetrant
567 dye was spilled into a storm drain and discharged from OF-007 (W-C, 1991).

568 **1.2.2.2 AOC 52: Facility Outfalls-001 through -006 and the Tidal Flats**

569 In 1953, six storm pump stations were built (Buildings B-36, B-37, B-38, B-39 [demolished in
570 1971], B-40, and B-41) that discharged to the Tidal Flats and Housatonic River via associated
571 outfalls (OF-001 through OF-006) (W-C, 1991) (**Figure 1-3**). Also, the outfalls received surface
572 runoff, which may have contacted wastes potentially spilled on the Site grounds (W-C, 1991).

573 In 1976, the OATP (Building B-64-2), an associated pump station (Building B-64-1), and OF-007
574 were constructed to address oil and grease from influent wastewater in the collection system to
575 meet NPDES requirements. Outlet piping was reconfigured for the existing pump houses, such
576 that base flow and the first flush of stormwater would be routed to the OATP for treatment prior
577 to discharge to the river via OF-007. The result was that discharge from OF-001 through OF-006
578 would occur only during large storm events when excessive runoff was present (W-C, 1991).

579 Specific amounts or constituents of materials/wastes that may have been discharged from
580 OF-001 through OF-006 in the past is not known; however, any material or waste discharged or
581 spilled into storm drains prior to construction of OATP was potentially released to the Tidal Flats
582 through one of these outfalls. Industrial wastewaters produced at SAEP have included boiler
583 blowdown, cooling water, laboratory wastes, photographic processing wastes, paint-
584 contaminated wastewater, soluble and insoluble cutting oils, spent hydraulic fluid, penetrant
585 dyes, brine, and emulsion cleaning detergents (ESE, 1981; W-C, 1991). These waste streams
586 likely contained waste fuels and solvents in addition to documented compounds. Further
587 information regarding the waste streams potentially handled by the outfalls is provided in the RI
588 Report (ACSIM, 2004).

589 Historically, waste oils, fuels, solvents, and paints likely have been released to the storm and
590 wastewater lines which lead to OF-001 through OF-006. Solvent, PCBs, and fuel-related
591 contaminants were detected in sediment samples located adjacent to the six facility outfalls
592 associated with the stormwater system. It should be noted, however, that in addition to impacts
593 from SAEP-originating contamination, some sediment samples in the eastern portion of the
594 Tidal Flats adjacent to the Housatonic River channel may be impacted by former historical
595 industrial operations upriver. As an additional note, the current SAEP shoreline is a result of
596 several expansions, most notably in 1943, which utilized both river sediments and fill from off-
597 site.

598 **1.2.2.3 AOC 25: Outfall-008 and Drainage Ditch**

599 This AOC consists of discharge from the former Chemical Waste Treatment Plant to OF-008 and
600 the associated drainage ditch (ACSIM, 2004) (**Figure 1-4**). The Outfall 008 drainage ditch is
601 located at the southern boundary of the site and was used to discharge treated wastewater
602 associated with metal plating into a drainage ditch that flows to the south. The drainage ditch
603 originates at Outfall 008. It is approximately 10 to 12 feet wide and generally less than 2 feet deep.
604 From Outfall 008 the ditch extends south-southeast a distance of 1,100 feet where it intersects a
605 perpendicular ditch. This perpendicular ditch formerly carried runoff from the airport (located to

606 the southwest, across Main Street) to Marine Basin (located 250 feet east of the junction of the
607 Outfall 008 Drainage Ditch and the perpendicular ditch). The Connecticut Department of
608 Transportation (CT DOT) re-routed this ditch in 2014, isolating it from the OF-008 ditch by creating
609 a new ditch that drains runoff from the airport and runs parallel to the OF-008 ditch, connecting
610 directly to the Marine Basin. In addition, a partially collapsed steel culvert which formerly ran
611 underneath dirt road 100 feet upstream of the east-west portion of the OF-008 drainage ditch was
612 removed in 2014. The steel culvert had limited tidal fluctuation impacts in the portion of the ditch
613 between the culvert and Outfall 008 until it was removed. Water in the perpendicular drainage
614 ditch flows to the Marine Basin, which in turn drains to the Housatonic River. There is a non-
615 functioning tide gate at the confluence of the OF-008 ditch and the Marine Basin which currently
616 limits tidal fluctuation impacts in the ditch between the culvert and the Marine Basin.

617
618 OF-008 was used to discharge supernatant from the waste treatment plant clarifier to the drainage
619 channel immediately northeast of Building B-18, to Marine Basin and ultimately the Housatonic
620 River. The outfall was constructed in 1979. The facility's 1985 NPDES permit allowed a discharge
621 of 190,000 gallons per day of treated finishing wastewater from the outfall, and in 1991, the
622 renewed NPDES permit allowed the facility to discharge 123,840 gallons per day of metal finishing
623 wastewater from cyanide and chromium plating operations via the outfall.

624 Records indicate that frequent violations of permit limitations (e.g., elevated pH levels, heavy
625 metals concentrations exceeding permitted levels, and discharges exceeding the allowable
626 maximum daily flow) occurred prior to the mid-1980s. Violations occurred after that time with less
627 frequency (ACSIM, 2004). During a 1984 USEPA inspection, white foam was observed where
628 lime-green colored liquids were being discharged from the CWTS clarifier into the tidal basin
629 (ACSIM, 2004). A review of the monthly Discharge Monitoring Reports for 1990 identified
630 violations of permit limitations for average daily flow and maximum daily concentration limits for
631 nickel, cyanide, and total toxic organics (ACSIM, 2004). Elevated levels of chlorinated volatile
632 organic compounds (VOCs), fuel-related VOCs, and other VOCs were detected during required
633 NPDES Permit sampling (ACSIM, 2004).

634 As part of the CT DOT Runway Safety Area Project (Re-alignment of CT Route 113, CT DOT
635 Project 15-336), in 2013 parts of the Outfall 008 drainage ditch and a portion of the property
636 adjacent to the ditch were evaluated for the presence of Raymark waste. The investigation
637 determined that Raymark waste was present adjacent to the Outfall 008 drainage ditch, and the
638 extent of Raymark waste is depicted in Figure 1-3 of the Final Sediment Remediation Endpoints
639 Report (Amec Foster Wheeler, 2018a). The Removal Work Plan identifies Raymark wastes at
640 depths up to 8 feet in areas adjacent to the drainage ditch, and states that "RMW (Raymark
641 Waste) extends into the tidal channel." The delineation of Raymark Waste did not extend
642 upstream along the drainage channel to the north, toward Outfall 008, beyond a limited area near
643 the junction of the "T" shape of the channel. The excavation of Raymark Waste was conducted in
644 2015, slightly altering the portion of the Outfall 008 drainage ditch adjacent to the former Raymark
645 Waste, including removal of a culvert crossing and regrading of the ditch banks. The final report
646 (AECOM 2015) does not indicate additional removals beyond those identified in the Removal
647 Work Plan (URS Corporation AES 2014) and presents a figure depicting the same extent of

648 removal as was identified in the work plan Figure 2. Confirmation sampling was performed only
649 along Route 113 at a location where excavation could not extend to the predetermined limits.
650 These figures both note that the limits of excavation were defined by borings that do not contain
651 Raymark waste (see figure 2 URS Corporation AES 2014). In addition, the design called for the
652 installation of sheetpile along and into the Outfall 008 ditch coincident with the line of samples
653 that did not contain Raymark waste, which was used during the remediation to control water. The
654 use of sheetpile would have prevented the inspection of sidewalls and/or collection of additional
655 confirmation samples within or immediately adjacent to the Outfall 008 ditch.
656

657 **1.2.3 Summary of Sediment Investigations**

658 There have been numerous investigations of the sediments in the Tidal Flats and Outfall 008
659 areas prior to 2014, and are summarized as follows:

- 660 ▶ Sampling of the Tidal Flats and Outfall 008 drainage ditch sediments was conducted
661 by the U.S. Army in 1992, 1994, and 1999 as part of a RI. These data are presented
662 in the RI Report (ACSIM, 2004).
- 663 ▶ The CTDOT also conducted sediment investigations in the Outfall 008 drainage ditch
664 in August 2012.
- 665 ▶ Background/reference sediment sampling was conducted in 1994, 1999, 2009, and
666 2012.
- 667 ▶ In April and May 2014, additional sediment sampling and toxicity testing were
668 conducted in the Tidal Flats and Outfall 008 drainage area. A description of
669 investigations and findings is presented in the Final Sediment Endpoints Report (Amec
670 Foster Wheeler, 2018a) (**Appendix A-1**).
- 671 ▶ In April 2015, additional sediment sampling was conducted in the Tidal Flats and
672 OF-008 areas, as follows:
 - 673 ○ between the Tidal Flats and the margin of the dredged Housatonic River
674 channel,
 - 675 ○ at depths greater than 2 feet below ground surface (bgs) in the Tidal Flats, and
 - 676 ○ at depths greater than 2 feet bgs in the OF-008 drainage ditch.

677 A description of investigations and findings is presented in the Addendum - Final
678 Sediment Endpoints Report (Amec Foster Wheeler, 2018a) (**Appendix A-2**).

- 679 ▶ In August 2017, limited pre-design investigations collected contaminated sediments
680 from the Tidal Flats to conduct treatability studies for potential land-side re-use of
681 sediments, as well as to characterize the sediments relevant to dredging, disposal,
682 and treatment evaluations. Treatability testing was conducted in accordance with the
683 Feasibility Study Final Field Sampling Plan (FSP) (Amec Foster Wheeler, 2018b). The
684 treatability testing included:

- 685 ○ sediment dewatering, flocculation, solidification/stabilization, disposal
686 characteristics, elutriate characteristics, and geotechnical properties; and
687 ○ evaluation of water treatment technologies to reduce PCBs and metals
688 concentrations in water generated from dewatering of sediments to meet likely
689 effluent discharge standards.

690 Evaluation of the treatability testing data is presented in **Appendix C**. Figure C-1
691 shows the locations of treatability sampling collection efforts.

692 ▶ In October 2017, additional sediment samples were also collected for geotechnical
693 parameter analysis at 10 locations across the Tidal Flats to provide a more
694 comprehensive spatial representation of the material to be removed. Geotechnical
695 samples were collected from depths ranging from 1 to 4 ft bgs and were composited
696 at each location. The grain size analyses associated with the samples are included in
697 **Appendix D** and are summarized in Section 3.0 of **Appendix C** and Table C-6.

698 ▶ In October 2017, additional sediment coring activities were completed to evaluate: 1)
699 the concentrations of total PCBs greater than or equal to 50 mg/kg in the 0-2 ft bgs
700 interval of the Tidal Flats sediments, and 2) concentrations of PCBs at depths between
701 4 and 8 ft bgs near the historic wastewater outfalls which discharged to the Tidal Flats
702 west of the Causeway, as presented in the Final FSP (Amec Foster Wheeler, 2018b).
703 The results of these investigations and the impact on sediment removal quantities is
704 presented in the Addendum to Final Sediment Remediation Endpoints Report (Amec
705 Foster Wheeler, 2018c), which is presented as **Appendix A-2**.

706 The investigations conducted in the Tidal Flats have adequately characterized the contamination
707 in sediments exceeding PRGs and requiring remediation. However, there remains the possibility
708 of residual contamination exceeding background concentrations at depths greater than 4 feet bgs
709 in the Tidal Flats from historic activities at SAEP, as well as former industrial processes along
710 Housatonic River. Future exposure to the potential presence of detectable contamination at
711 depths below 4 feet is not anticipated; however, the Army proposes some limited pre-design
712 sediment characterization in those areas where ERM-Q > 0.5 in the 3-4 foot bgs interval to
713 evaluate those areas to a depth of 6 feet bgs, sampling over the 4-5 ft and 5-6 ft intervals. The
714 proposed characterization program is presented in **Appendix A-3**.

715 **Appendix A-4** contains an evaluation of LiDAR elevation surveys of the Tidal Flats (conducted in
716 2006, 2012, and 2015) encompassing the timeframe of Hurricane Sandy (October 2012) to
717 assess the potential impacts of a severe storm event on the sediments of the Tidal Flats. The
718 primary conclusions of this evaluation are as follows:

- 719 • Between the years 2006 and 2015, the mean elevation of the Tidal Flats surface
720 increased by 0.39 feet.
- 721 • In October 2012, Hurricane Sandy's effects impacted the Connecticut coast, and
722 immediately after the event, a LiDAR elevation survey of the Connecticut coast was
723 conducted.

- 724
- 725
- 726
- The evaluation in **Appendix A-4** provides an estimate of a mean elevation increase across the Tidal Flats of 0.14 feet between 2006 and immediately following Hurricane Sandy in November 2012.
- 727
- However, using an estimated sedimentation rate of 0.07 feet/year (calculated from a comparison of the 2012 and 2015 data sets), the theoretical amount of increase between 2006 and 2012 if Hurricane Sandy had not occurred should have been on the order of 0.42 feet, yielding a maximum theoretical amount of sediment elevation decrease from Sandy of 0.28 feet.
- 728
- 729
- 730
- 731
- Evaluation of LiDAR data by Wood indicates that between 2006 and 2015, the elevation of the Tidal Flats sediments generally increased, with a mean increase of 0.39 feet over the 9-year period inclusive of Hurricane Sandy. Even with the impacts of Hurricane Sandy, these data support that sedimentation processes are occurring within the Tidal Flats.
- 732
- 733
- 734
- 735
- 736
- Using a sedimentation rate of 0.07 ft/yr, it is estimated that it would take roughly 14 years for a 1-foot thickness of new sediment to accumulate on the Tidal Flats. However, this does not consider that if the Tidal Flats were excavated and backfilled to 1 foot below existing grade, the non-equilibrium condition generated by leaving the last 1-foot unfilled would likely increase the rate of sedimentation. Increases in sedimentation rates have been documented at other sediment excavation sites where excavations have not been completely backfilled to grade (<http://www.nae.usace.army.mil/Portals/74/docs/DAMOS/TechReports/186.pdf>).

745 **1.3 Summary of Pathway to Sediment Remediation Goals**

746 In October 1995, SAEP was placed on the Base Closure and Realignment (BRAC) list, known as
747 BRAC 95. U.S. Army BRAC properties must be investigated to determine the nature and extent
748 of environmental contamination. The U.S. Army prepared a RI Report (ACSIM, 2004) for the
749 SAEP to characterize the nature and extent of contamination and evaluate potential risk to human
750 health and the environment attributable to the Site.

751 As presented in the RI Report, under the legal and regulatory framework of the CERCLA, remedial
752 action and cleanup standards at SAEP will be primarily driven by the CERCLA §120(a)(4)
753 mandate to meet the legally applicable state laws at non-NPL facilities. Under this mandate, two
754 legally applicable state requirements will drive the remedial actions/cleanup standards at the site:
755 (1) the Connecticut Remediation Standard Regulations (RSRs) for soil and groundwater, and (2)
756 the Connecticut Surface Water Standards. Since these criteria are required to be met, regardless
757 of the presence or absence of unacceptable risk, the risk assessment process in this RI Report
758 serves a modified use other than the traditional use of a risk assessment in a RI Report. For
759 those exposure pathways/media covered by the above applicable requirements, the risk
760 assessment will not be decisive of the need for remedial action. Instead, the exceedance of the
761 RSR standards/surface water standards will determine the need for remedial action. For these
762 exposure pathways/media, the human health and ecological risk assessments in the RI Report

763 will be primarily utilized as a basis to develop alternative criteria under the RSRs, when
764 determined to be pertinent and to clearly demonstrate compliance with the CERCLA
765 protectiveness mandate in the administrative record.

766 The RI Report states that for exposure pathways/media not covered by the above applicable
767 requirements (i.e., sediment and ecological receptors), the risk assessment will be used in the
768 traditional sense to identify media/exposure pathways that require remedial action to meet the
769 CERCLA protectiveness mandate.

770 The RI Report (ACSIM, 2004) utilized the results of the investigations completed prior to 2002 to
771 develop human health and ecological risk assessments to evaluate risk associated with the
772 sediments of the Tidal Flats and Outfall 008 drainage ditch. The Human-Health Baseline Risk
773 Assessment (HHBRA) considered exposure to sediments for recreational and commercial
774 anglers and shell-fishermen (Harding ESE, 2004). The following bullets summarize the HHBRA
775 findings for potential exposure to sediments and consumption of biota:

776 • Tidal Flats:

- 777 ○ Cumulative cancer risks to future recreational visitors (2E-04) and commercial
778 fishermen (2E-04) for consumption of oysters from the Tidal Flats exceed the CERCLA
779 1E-04 total cumulative cancer risk threshold required to take an action.
- 780 ○ Risks associated with potential exposures to chemicals of potential concern (COPCs)
781 in sediment under future recreational use conditions (wading or angling) at the Tidal
782 Flats are 1E-05, and do not exceed the CTDEP cancer risk limit of 1E-05, applicable
783 when evaluating multiple substances.
- 784 ○ Risks associated with hypothetical future commercial fishing for dermal contact and
785 ingestion of sediment from the Tidal Flats are 1E-05, and do not exceed the CTDEP
786 cancer risk limit of 1E-05, applicable when evaluating multiple substances.
- 787 ○ Risks to recreational fishermen associated with consumption of finfish (1E-04) and
788 ribbed mussels (1E-04) at the Tidal Flats exceed the CTDEP cancer risk limit of 1E-
789 05 (applicable when evaluating multiple substances), and an HI of 1, due to PCB
790 Aroclors 1248, 1254, and 1260.
- 791 ○ Risks to hypothetical future commercial fishermen associated with consumption of
792 finfish, ribbed mussels, and oysters taken from the Tidal Flats exceed the CTDEP
793 cancer risk limit of 1E-05 (applicable when evaluating multiple substances), due to
794 PCB Aroclors 1254 and 1260, and arsenic.

795 • Outfall 008:

- 796 ○ Total receptor risks associated with potential exposures to chemicals of potential
797 concern (COPCs) in sediment under future recreational use conditions (child,
798 adolescent, and adult wading) at the Outfall 008 drainage ditch are 8E-06, and do not
799 exceed the CTDEP cancer risk limit of 1E-05, applicable when evaluating multiple
800 substances.

801 ○ The estimated hazard index (HI) value for future recreational use (wading) at the
802 Outfall 008 Drainage ditch does not exceed a value of 1 under the assumption that
803 chromium detected in ditch sediments is present as trivalent chromium (it is likely that
804 the total chromium in the sediments is in the trivalent form because of the anaerobic
805 conditions in this medium).

806 The Baseline Ecological Risk Assessment (BERA) was conducted to characterize ecological risks
807 at the site in accordance with USEPA performance standards for risk characterization (ACSIM,
808 2004). The following bullets summarize the BERA findings for potential risks to ecological
809 receptors in the Tidal Flats and Outfall 008 drainage ditch:

810 • Tidal Flats:

- 811 ○ The BERA indicates that there is no unacceptable risk to macroinvertebrates in the
812 Tidal Flats.
- 813 ○ The results of the BERA indicate that there is no significant risk to forage fish inhabiting
814 the Tidal Flats; tissue concentrations are comparable to tissue concentrations from
815 reference locations.
- 816 ○ At the Tidal Flats, there is no significant risk to the black duck and great blue heron,
817 but a potential risk to sandpipers due to chromium in sediment and mercury (assumed
818 to be methyl mercury) in biota.

819 • Outfall 008:

- 820 ○ There is a potential risk to macroinvertebrates in the Outfall 008 drainage ditch due to
821 inorganics (barium, chromium, and copper) and Aroclor-1260 in sediment.
- 822 ○ At Outfall 008, chromium concentrations in sediment may pose a risk to sandpipers,
823 herons, and ducks if they frequently forage at this location (considered unlikely due to
824 poor habitat quality).

825 Based on the age of the sediment data (1992-1998) associated with the HHBRA and BERA, the
826 CT DEEP requested that, prior to establishment of remedial goals for sediment in the Tidal Flats
827 and Outfall 008 drainage ditch sediments, additional sediment characterization, including toxicity
828 testing, be conducted.

829 In April 2014, the U.S. Army issued the Final Work Plan for Determination of Sediment
830 Remediation Endpoints, Tidal Flats and Outfall 008, Stratford Army Engine Plant, Stratford,
831 Connecticut (AMEC, 2014a). This work plan was reviewed and approved by the CT DEEP. The
832 Work Plan proposed sediment toxicity testing to assist in developing the remediation endpoint
833 goals for the sediments in question and laid out the steps for development of the remediation
834 endpoints. The Final Work Plan also presented some of the historical sediment data referenced
835 above. In April and May 2014, additional sediment sampling and toxicity testing were conducted,
836 and in September 2014 the Army issued the Draft Sediment Remediation Endpoints Report for
837 the Tidal Flats and Outfall 008 (AMEC, 2014b). The report presented the results of sediment
838 chemical characterization, toxicity testing results, and proposed sediment remediation endpoints
839 for the Tidal Flats and Outfall 008 areas. The results of the toxicity testing indicated toxicity to
840 macroinvertebrates from sediment, in contrast to earlier BERA findings, although the toxicity could

841 not be linked to a specific chemical. As an alternative to using toxicity test results alone for
842 development of remediation endpoints, the report presented statistical analyses of the data and
843 proposed using an ERM-Q of 1.0 for the metals cadmium, chromium, and copper, as a surrogate
844 for evaluation of toxicity.

845 On December 2, 2014, the CT DEEP submitted comments on the Draft Sediment Remediation
846 Endpoints Report (AMEC, 2014b). CT DEEP concluded from their review of the report that toxicity
847 is not definitively linked with a specific chemical and recommended setting the remedial goal
848 based on multiple chemicals to more accurately describe the chemical quality associated with the
849 non-toxic samples. CT DEEP's recommendations for determining the sediment remediation
850 endpoint goals were as follows:

- 851 • Use an average ERM-Q of 0.5 for the eight metals arsenic, cadmium, chromium, copper,
852 lead, nickel, silver, and zinc; an average ERM-Q > 0.5 would require remediation.
- 853 • Concentrations of mercury and PCBs should generally not be present in post-remedial
854 conditions.
- 855 • Additional site characterization was needed to refine the area of sediment contamination
856 both at depth within the Tidal Flat and Outfall 008 areas, as well as within surficial and
857 deeper sediments between the eastern edge of the intertidal flats and the Housatonic
858 River.

859 On February 17, 2015, the U.S. Army responded to CT DEEP's comments indicating that they
860 agreed to removal of contaminated sediments with average ERM-Qs > 0.5 from the 0-2 foot bgs
861 interval in both the Tidal Flats and Outfall 008 areas, as well as replacement with CT DEEP-
862 approved backfill.

863 Following further discussions with CT DEEP, the U.S. Army issued a memorandum to CT DEEP
864 on March 24, 2015 indicating that they were committed to proceeding with the additional sampling
865 in a timely manner to ensure redevelopment of the SAEP site without further delay.

866 In April 2015, additional sediment sampling was conducted in the Tidal Flats and Outfall 008
867 areas, as follows:

- 868 • between the Tidal Flats and the margin of the dredged Housatonic River channel,
- 869 • at depths greater than 2 feet bgs in the Tidal Flats, and
- 870 • at depths greater than 2 feet bgs in the Outfall 008 drainage ditch.

871 In November 2015, Amec Foster Wheeler was placed under contract to analyze the sediment
872 samples collected in April 2015, and to incorporate the analytical results into a revised version of
873 the Sediment Remediation Endpoints Report. The revised Sediment Remediation Endpoints
874 Report was issued to the U.S. Army on July 29, 2016, and to the CT DEEP on March 7, 2017.

875 On May 17, 2017, the U.S. Army received comments from the CT DEEP on the Sediment
876 Remediation Endpoints Report. These comments, and responses from the U.S. Army, are
877 included as Appendix F of the Final Sediment Remediation Endpoints Report (Amec Foster

878 Wheeler, 2018a) (**Appendix A-1**). Because of CT DEEP and USEPA comments, the U.S. Army
879 developed a Field Sampling Plan (Amec Foster Wheeler, 2018c) to conduct sediment sampling
880 and analyses in the Tidal Flats to further delineate:

- 881 • concentrations of PCBs from 0-2 feet bgs at locations where total PCBs have been
882 detected at concentrations exceeding 50 ppm; and
- 883 • concentrations of PCBs and Hg at depths between 4 and 8 feet bgs near the historic
884 wastewater outfalls which discharged to the Tidal Flats west of the Causeway.

885 The results of these investigations and the impact on sediment removal quantities is presented in
886 the Addendum to Final Sediment Remediation Endpoints Report (Amec Foster Wheeler, 2018b),
887 which is presented as **Appendix A-2**.

888 **2.0 REMEDIAL ACTION OBJECTIVES AND APPLICABLE OR RELEVANT**
889 **AND APPROPRIATE REQUIREMENTS**

890 This section presents ARARs, development of PRGs, RAOs, and development of areas and
891 volumes of media to be remediated for the Tidal Flats (AOC 52) and the OF-008 Drainage Ditch
892 (AOC 25).

893 **2.1 Applicable or Relevant and Appropriate Requirements**

894 The CERCLA, the Superfund Amendments and Reauthorization Act, and the NCP require that
895 on-site Superfund remedial actions attain federal standards, requirements, limitations, or more
896 stringent state standards determined to be legally applicable or relevant and appropriate to the
897 circumstances at a given site. ARARs are federal and state environmental and facility siting
898 requirements and guidelines used to:

- 899 ▶ evaluate the appropriate extent of site cleanup;
- 900 ▶ define and formulate remedial action alternatives; and
- 901 ▶ govern implementation and operation of the selected action.

902 Inherent in the interpretation of ARARs is the assumption that protection of human health and the
903 environment is ensured.

904 Numerous federal and state laws and their implementing regulations were reviewed to identify
905 ARARs for potential cleanup levels and other action- and location-specific requirements for the
906 site. This section defines ARARs and discusses specific laws and regulations that were
907 considered as potential ARARs as they apply to remedial actions to be applied to this Project.
908 Relevant federal and state guidance documents were also reviewed as potential To Be
909 Considered criteria. **Figure 2-1** presents the USACE ARAR Logic Flowchart that provides the
910 method for determining if a regulation is an ARAR. The NCP defines two ARAR components: (1)
911 applicable requirements; and (2) relevant and appropriate requirements. To properly consider
912 ARARs and to clarify their function in the remedy selection process, these definitions must be
913 considered.

914 CERCLA considers **applicable** requirements to include cleanup standards, standards of control,
915 and other substantive requirements, criteria, or limitations promulgated under federal
916 environmental or state environmental or facility siting laws that specifically address a hazardous
917 substance, pollutant, contaminant, remedial action, location, or other circumstance found at a
918 CERCLA site.

919 **Relevant and appropriate** requirements include those cleanup standards, standards of control,
920 and other substantive requirements, criteria, or limitations promulgated under federal
921 environmental or state environmental or facility siting laws that, while not “applicable” to a
922 hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at

923 a CERCLA site, address problems or situations sufficiently similar to those encountered at the
924 CERCLA site such that their use is well suited to the particular site.

925 CERCLA considers three types of ARARs:

926 ▶ **Location-specific ARARs** are requirements driven by the geographical or physical
927 position of the site, rather than by the nature of the chemicals of concern or the actions
928 at the site. Location-specific ARARs are typically restrictions or requirements placed
929 on the concentration of hazardous substances or the conduct of activities solely
930 because they occur in a specific location.

931 ▶ **Chemical-specific ARARs** are laws and regulations that identify health- or risk-based
932 numerical values that, when applied to site-specific conditions, result in the
933 establishment of concentration cleanup limits for specific hazardous substances.
934 These limits establish the acceptable amount or concentration of a chemical that may
935 be found in, or discharged to, the environment.

936 ▶ **Action-specific ARARs** are requirements that define acceptable performance,
937 design, or other similar controls or restrictions imposed on particular kinds of activities.
938 Action-specific ARARs are usually technology- or activity-based requirements.

939 In general, chemical- and location-specific ARARs provide a basis for determining the objectives
940 and goals of remedial action for the site, whereas action-specific ARARs provide a basis for
941 determining how the remedial action will be implemented.

942 **Table 2-1** provides a list of the ARARs that have been evaluated and determined to be relevant
943 to the screening and evaluation of remedial alternatives based on site conditions and results of
944 the RI and other investigations. The selected remedial alternative will be implemented in
945 accordance with the substantive requirements of all applicable federal, state, and local regulations
946 and permitting requirements to the extent practicable. The ARARs provide the location-,
947 chemical-, and action-specific requirements relevant to the alternatives identified in the FFS only
948 – ARARs for the actual selected remedy may differ and will need to be evaluated upon remedy
949 selection, design, and implementation.

950 Several regulations will be followed during the implementation of the selected remedy but are not
951 ARARs. For example, RCRA is not an ARAR as RCRA pertains to the potential off-site disposal
952 and ARARs are on-site requirements only. RCRA requirements, among others, will be followed
953 in the transport and disposal of residual materials off-site. However, as RCRA and several other
954 regulations do not impact the FFS, these regulations are not ARARs and are not included in the
955 FFS; however, are provided in **Table 2-1** for information purposes only.

956 Similarly, OSHA is not identified as an ARAR; however, all work conducted by USEPA or work
957 completed under Superfund must be OSHA-compliant.

958 Other requirements that will be followed during the implementation of the remedial action that are
959 not ARARs include the Endangered Species Act and the National Historic Preservation Act;

960 however, the USACE will coordinate wetland activities with the local jurisdictions to meet
961 substantive requirements.

962 **State and Federal-listed Species.** On April 23, 2018, CT DEEP sent a letter to Amec Foster
963 Wheeler regarding the impact of the proposed remediation on State-listed species (Appendix B).
964 The letters signee, Shannon B. Kearney (Wildlife Biologist), stated that based on the review of
965 Natural Diversity Data Base maps and files, the proposed activities are not anticipated to
966 negatively impact State-listed species. This review is based on the current scope of work and is
967 viable for work started before April 23, 2020.

968
969 CENAE has coordinated with USFWS and NMFS regarding impacts of the proposed project on
970 federally listed species under Section 7 of the Endangered Species Act of 1973 (16 U.S.C § 1531
971 et seq.) and that correspondence will be completed during final design.

972
973 **Time-of-Year Restrictions.** There are three potential time-of-year dredge restrictions that are
974 of concern based upon informal consultation discussions with State and Federal resource
975 agencies including:

- 976
977
 - winter flounder spawning (February 1st- May 31st);
 - anadromous fish migration (March 1st - June 30th);
 - oyster spawning (June 1st - October 1st).

980
981 If implemented, these dredge restriction periods would occur annually over the life of the project
982 and would allow for a four-month work window (October 1st through January 31st). For purposes
983 of cost and schedule estimation, it has been assumed that the allowable work window will be
984 from July 1st through January 31st assuming the oyster spawning window can be eliminated.
985 Suspended sediment produced during dredging would be contained to the immediate dredge
986 area (tidal flats) in accordance with the approved turbidity monitoring, management, and
987 maintenance program and would not have a substantial impact on oyster resources that are
988 harvested within the main river channel of the Housatonic River. Also, oysters are well adapted
989 to withstand temporary increases in suspended sediments and sedimentation within the main
990 river channel is not likely to exceed levels experienced during natural storm events.

991
992 Based on USACE analysis of these environmental resources, remedial dredging should be
993 conducted without any time-of-year restrictions to ensure project impacts do not span multiple
994 seasons. In addition, if completion of the work is compressed into no more than one or two
995 seasons, the disturbed habitat can be recolonized and utilized by local fauna much more quickly
996 than if work must extend into three or more seasons.

997
998 **2.2 Preliminary Remediation Goals**

999 A summary of the pathway to determination of sediment remedial goals is presented in Section
1000 1.3 of this FFS Report. The PRGs for the Tidal Flats sediments are as follows:

- 1001
 - ▶ Sample locations with an average ERM-Q value greater than or equal to 0.5 for eight

1002 metals will be excavated, and

1003 ▶ PCB and mercury concentrations after remediation will be not substantially different
1004 from those found in reference locations.

1005 As presented in the Final Sediment Remediation Endpoints Report, the U.S. Army has agreed
1006 with CT DEEP to remediate the entire length of the OF-008 drainage ditch (inclusive of the “T”
1007 section extending to Route 113 to the southwest and Marine Basin to the northeast) to a depth
1008 of 4 ft bgs.

1009 **2.3 Remedial Action Objectives**

1010 Remedial action objectives are specific goals for protecting human health and the environment
1011 and ecological receptors that also define a framework for remediation sites. The following RAO
1012 was identified for the Tidal Flats:

1013 ▶ Reduce risk to the environment by reducing sediment toxicity in the top 4 ft of sediment
1014 by removing sediment with average ERM-Q values greater than or equal to 0.5 for
1015 eight Site-related metals (arsenic, cadmium, chromium, copper, lead, nickel, silver,
1016 and zinc);

1017 By achieving this RAO, total PCBs and mercury remaining within the footprint of the removal area
1018 will be at concentrations not substantially different than those found in reference locations (0.2
1019 ppm for total PCBs and 0.4 ppm for mercury). As presented in Appendix A-2, the mean and 95%
1020 UCL concentrations of total PCBs and mercury remaining following the proposed removal of
1021 sediment within the ERM-Q > 0.5 footprint are less than the CT DEEP-proposed background
1022 concentrations of 0.2 and 0.4 ppm, respectively.

1023 In addition, cancer risks for future recreational and commercial fishermen and anglers from
1024 multiple PCB Aroclors and arsenic in Tidal Flats sediments as identified in the HHRA (ACSIM,
1025 2004) will be reduced and are anticipated to be well below the CT DEEP cancer risk limit of 1E-05,
1026 applicable when evaluating multiple substances, in post-removal conditions.

1027 The following RAOs were identified for the OF-008 Drainage Ditch:

1028 ▶ Reduce risk to the environment by reducing sediment toxicity in the top 4 ft of sediment
1029 by removing all sediments along the entire length of the OF-008 drainage ditch
1030 (inclusive of the “T” section extending to Route 113 to the southwest and Marine Basin
1031 to the northeast) to a depth of 4 ft bgs.

1032 Potential risk to sandpipers due to chromium in sediment and mercury (assumed to be methyl
1033 mercury) in biota as identified in the BERA (ACSIM, 2004) will be significantly reduced by the
1034 proposed removal of sediments in the Tidal Flats and Outfall 008 drainage ditch.

1035 It is important to note that the RAOs incorporate the U.S. Army’s overarching objective to eliminate
1036 to the extent feasible any long-term liability for contamination remaining on the Site within the
1037 Tidal Flats and the Outfall 008 drainage ditch. The U.S. Army has placed emphasis on remedial
1038 actions that reduce ecological risk through **removal** of sediment rather than those actions that
1039 rely upon containment, consolidation, or only in situ treatment of sediments within AOCs 25 and

1040 52. By removing sediments exceeding PRGs and achieving the RAOs, the U.S. Army would
1041 eliminate any requirements to perform long-term monitoring and maintenance of the remedy.
1042 Consistent with this strategy, remedial approaches that have been screened out at the very first
1043 steps of the alternatives development process prior to the detailed evaluation include:

- 1044 • Monitored Natural Recovery
- 1045 • Containment; and
- 1046 • In Situ Treatment.

1047 These RAOs and the U.S. Army's preference for removal were used to guide the screening of
1048 suitable technologies, as well as the development and evaluation of remedial action alternatives
1049 in Sections 5 and 6 of this FFS in accordance with CERCLA.

1050 **2.4 Areas and Volume of Media (Tidal Flats and Outfall 008 Ditch)**

1051 **2.4.1 Tidal Flats**

1052 The proposed remedial footprint for Tidal Flats sediments, and the rationale for its selection, is
1053 presented in **Appendix A-2**. Sediments with average ERM-Q values greater than or equal to 0.5
1054 were considered to require remediation. For each depth interval, interpolated areas of sediments
1055 with average ERM-Q values greater than or equal to 0.5 were drawn. Total PCB (both Aroclors
1056 and Homologs) data from 1992 through 2017 were plotted by depth interval to evaluate total PCB
1057 concentrations relative to the average ERM-Q based remedial footprint (**Appendix A-2**). In
1058 addition, the interpolated areas of PCB concentrations between 1 and 50 ppm, and > 50 ppm
1059 were drawn. Figures of total mercury data from 1992 through 2017 were created by depth interval
1060 to evaluate mercury concentrations relative to the average ERM-Q based remedial footprint
1061 (**Appendix A-2**).

1062 **Figure 2-2** represents the proposed remediation footprint for the Tidal Flats based on the
1063 conclusions of **Appendix A-2**. As depicted in the **Figure 2-2**, approximately 47 acres of tidal flats
1064 area require remediation ranging from one to four ft of sediment removal. A majority of the area
1065 (approximately 38 acres) requires one or two feet of removal, with the remaining ten acres
1066 requiring three or foot ft of sediment removal. No remediation is proposed below 4 ft bgs, as there
1067 are no average ERM-Q values > 0.5, and no concentrations of PCBs or mercury exceeding CT
1068 DEEP-proposed background concentrations of 0.2 and 0.4 ppm, respectively (see **Appendix A-**
1069 **2**).

1070 **Figure 2-3** through **Figure 2-6** represent the remediation footprints of PCBs at concentrations
1071 greater than 1 and less than 50 ppm, and greater than or equal to 50 ppm within the Tidal Flats.
1072 **Figures 2-7** and **Figure 2-8** represent cross-sections of the Tidal Flats where the section lines
1073 are shown on **Figure 2-2**. **Table 2-2** presents a summary of the estimated volume of in-place
1074 sediments proposed for removal from the Tidal Flats Area, which totals approximately 139,400
1075 cy. For purposes of compliance with TSCA and for categories of on-site beneficial reuse and off-
1076 site disposal, the sediments have been categorized according to three ranges of PCB

1077 concentrations: less than 1 mg/kg PCBs, greater than or equal to 1 mg/kg but less than 50 mg/kg
1078 PCBs, and greater than or equal to 50 mg/kg PCBs. Most of this volume of sediment contains
1079 PCBs at concentrations less than 1 mg/kg PCBs (130,500 cy). A relatively small volume contains
1080 PCBs between 1 and 50 mg/kg (8,500 cy), and a very small amount contains PCBs greater than
1081 or equal to 50 mg/kg (400 cy). Sediments containing greater than or equal to 1.0 ppm PCBs are
1082 regulated under TSCA at this facility.

1083 **2.4.2 OF-008 Drainage Ditch**

1084 As discussed with CT DEEP, the U.S. Army agreed to remediate the entire length of the OF-008
1085 drainage ditch to a depth of 4 ft bgs (Amec Foster Wheeler, 2018a). The proposed remedial
1086 footprint for the 0-4 foot depth interval and cross-sections are depicted in **Figure 2-9** through
1087 **Figure 2-15**. The proposed PCB remedial footprint for concentrations greater than or equal to 1
1088 and less than 50 ppm is shown on **Figures 2-10** and **2-11**. **Table 2-3** presents a summary of the
1089 estimated volume of in-place sediments proposed for removal from OF-008 drainage ditch, which
1090 totals approximately 4,900 cy. Approximately 3,800 cy of this volume contains PCBs at
1091 concentrations less than 1 mg/kg. The remainder of the volume (1,100 cy) contains PCBs at
1092 concentrations less than 50 mg/kg but greater than or equal to 1 mg/kg.

1093 **3.0 IDENTIFICATION AND SCREENING OF TECHNOLOGY TYPES AND**
1094 **PROCESS OPTIONS**

1095 This section identifies and screens potential remedial technologies that will be combined into
1096 remedial alternatives to address impacted sediment at the Site. Following identification,
1097 candidate technologies are screened based on their applicability to site- and contaminant-limiting
1098 characteristics. Site-limiting characteristics consider the effects of physical features on the
1099 implementability of a technology, such as topography/bathymetry, geology, and available space
1100 and resources to implement the technology. Contaminant-limiting characteristics consider the
1101 suitability of a technology based on contaminant types, as well as physical and chemical
1102 properties of the waste (e.g., grain size, organic carbon content, volatility, solubility, and mobility).

1103 The process to identify and screen technologies includes the following steps:

1104 1. First, GRAs with potential to attain the RAOs established in Section 2 were identified.
1105 GRAs are broad categories of remedial actions or strategies that may be appropriate to
1106 reduce site risks. Section 3.1 below lists the GRAs identified for the project. To eliminate
1107 those GRAs that will not meet the RAOs and avoid the unnecessary step of also identifying
1108 and screening technologies that fall under those GRAs, an initial screening step of GRAs
1109 only was performed. This screening step is presented in **Table 3-1** and summarized below
1110 in Section 3.1. This approach is consistent with the U.S. Army's approach to minimizing
1111 long-term liability and maintenance activities at the Site.

1112 2. Next, an extensive list of potential technologies representing each remaining GRA was
1113 developed based on experience with similar studies, site media, and contaminant-driven
1114 considerations. Remediation technologies are grouped by category in
1115 **Table 3-2**, with individual technology process option(s) identified. Demonstrated
1116 performance of each technology for site contaminants and conditions is considered during
1117 technology identification.

1118 3. Lastly, the resulting list of potential technologies was then screened against the
1119 effectiveness, implementability, and criteria. Costs at this stage of the process are
1120 generally defined in relative terms only (i.e., high, medium, and low), rather than
1121 quantitatively, and are generally not used to screen out technologies; however, costs can
1122 be used to differentiate between similar process options to aid in selection of appropriate
1123 process options to carry forward into alternatives development. Site- and waste-limiting
1124 characteristics are identified under these criteria to ensure that only the most promising
1125 technologies are carried forward into alternatives development. Additionally, to refine the
1126 development of site-wide remedial alternatives with technologies that have multiple
1127 process options, only the most promising process options applicable to each GRA are
1128 carried forward. This process ensures that only those technologies and process options
1129 applicable to Site contaminants, with consideration of the physical characteristics of the

1130 Tidal Flats and OF-008 drainage ditch are carried forward for combination into remedial
1131 alternatives.

1132 **3.1 General Response Actions**

1133 GRAs are broad categories of remedial actions that may be implemented to attain RAOs by
1134 reducing contaminant concentrations in each medium below the PRGs, preventing receptor
1135 exposure to the contaminated medium, or monitoring the natural attenuation of contaminants.

1136 Potential GRAs for the Tidal Flats and OF-008 include:

- 1137 ▶ Institutional Controls
- 1138 ▶ Monitored Natural Recovery
- 1139 ▶ Containment
- 1140 ▶ In situ Treatment
- 1141 ▶ Removal
- 1142 ▶ Material Transport
- 1143 ▶ Material Dewatering and Processing
- 1144 ▶ Disposal
- 1145 ▶ Habitat Restoration

1146 Brief descriptions of these GRAs are included in **Table 3-1**.

1147 Monitored natural recovery (MNR), containment, and in-situ treatment were eliminated because
1148 these GRAs would not remove targeted sediments and would leave the U.S. Army with long-term
1149 obligations such as monitoring and maintenance. The U.S. Army's objective for the sediment
1150 remediation is to eliminate future liability for any contamination left in place at the Site, and to
1151 transfer that liability to the future property owner for any sediments placed within the uplands
1152 portion of the site for beneficial reuse. Institutional controls have been retained only as an ancillary
1153 (not primary) component (to the extent necessary) of all remedial alternatives. Habitat restoration
1154 has been retained for the OF-008 drainage ditch and the salt marshes of the Tidal Flats, which
1155 will require revegetation and restoration. The remainder of the Tidal Flats will require simple
1156 backfill to restore the remediation footprint to a depth of 1 foot below the pre-remediation
1157 elevation.

1158 The following subsections describe in more detail the rationale for screening out MNR,
1159 Containment, and In Situ Treatment.

1160 **3.1.1 Monitored Natural Recovery**

1161 MNR is one of the three main remedial alternatives for contaminated sediment recognized by US
1162 EPA that are typically addressed at sediment sites (removal "dredging" and capping "containment"
1163 are the others). MNR relies upon ongoing, naturally occurring processes to contain, destroy, or

1164 reduce the bioavailability or toxicity of contaminants in sediment. These processes can convert
1165 contaminants to less toxic forms (biodegradation), bind contaminants more tightly to sediment
1166 (sorption), or bury contaminated sediment beneath clean sediment (sedimentation). For this Site,
1167 natural sedimentation is generally the process which constitutes MNR. Long-term monitoring with
1168 sediment sampling occurring at a set frequency (i.e., quarterly, semi-annual, and/or annual) is
1169 required as part of MNR to document reduction in sediment concentrations through deposition of
1170 incoming “cleaner” sediment, and/or dilution to reduce concentrations of impacted sediments.

1171 MNR would not immediately remove or reduce contaminant concentrations and would therefore
1172 not meet the U.S. Army’s preference for actions that eliminate long-term monitoring and
1173 maintenance at the Site. For these reasons, MNR will not be considered for further evaluation.

1174 **3.1.2 Containment**

1175 Like MNR, contaminated sediments exceeding PRGs would not be removed; rather, an
1176 engineered barrier would be placed over the contaminated sediments to isolate them and prevent
1177 migration of contamination. Caps are typically designed with several layers depending on
1178 contaminant concentration(s) and type(s), migration of contamination, erosion potential, and
1179 ecological considerations such as appropriate substrate. An isolation layer to provide physical
1180 separation between contaminated sediment and the bioturbation zone may be a component.
1181 Additionally, a chemical treatment layer consisting of an aggregate material, such as sand treated
1182 with a chemically active treatment material such as activated carbon or other specialty media,
1183 may be a cap component. Above this layer, an erosion protection layer may be required to prevent
1184 the loss of upper layers of the chemical isolation or treatment zones. The erosion layer may have
1185 more than one material type depending on the gradation compatibilities. Finally, a bioturbation
1186 zone is typically required to re-establish habitat for benthic and other organisms.

1187
1188 Typically, some amount of removal of contaminated sediments is required to “fit” the cap without
1189 filling the waterway. The depth of removal depends on the design thickness of each of the layers
1190 required for the cap.

1191
1192 Containment, as a GRA, has been screened from further consideration because removal of
1193 sediments exceeding PRGs to a depth of four feet would not be accomplished. Under this GRA,
1194 long-term liability would not be eliminated for the U.S. Army because some amount of sediments
1195 exceeding the PRGs would remain on the Site, obligating the U.S. Army to perform long-term
1196 monitoring and maintenance of the cap. For these reasons, containment has been eliminated
1197 from further consideration.

1198 **3.1.3 In Situ Treatment**

1200 In-situ treatment relies on the use of amendments dispersed on top of sediment to create a
1201 shallow treatment zone. Within this shallow treatment zone, the amendments alter the physical
1202 or chemical properties of the sediment, porewater, and/or contaminants to reduce the
1203 bioavailability of contaminants to benthic organisms. In situ treatment can be effective to interrupt
1204 processes of bioaccumulation to protect higher level organisms. In situ treatment has been well
1205 demonstrated for PCBs and some metals; however, it is a relatively recent technology that has

1206 not been extensively used. Multiple applications of in situ treatment amendments are likely
1207 required over time to ensure effectiveness.

1208
1209 In situ treatment would not include any removal of contaminated sediments, and for reasons
1210 similar to those for containment and MNR (i.e., long-term liability and monitoring and maintenance
1211 required by the U.S. Army), it has been eliminated from further consideration in this FFS.

1212 **3.2 Technology Identification**

1213 Remedial technologies and process options were identified for the remaining GRAs based on a
1214 review of engineering experience, literature, vendor information, and past performance data.
1215 Process options with the potential to attain RAOs are identified in **Table 3-2** which also further
1216 identifies the applicability of technologies to the Tidal Flats and OF-008 drainage ditch
1217 remediation.

1218 **3.3 Screening of Technologies**

1219 The purpose of the screening step is to reduce the number of potentially applicable technologies
1220 and process options by evaluating factors that may influence effectiveness, implementability, and
1221 relative cost. This overall screening is consistent with guidance for performing FSs under
1222 CERCLA (USEPA, 1988). **Table 3-2** summarizes the technology screening process.

1223 Technologies and process options judged ineffective, not implementable or too difficult to
1224 implement, or too costly were eliminated from further consideration. The technologies retained
1225 following screening represent the inventory of technologies considered most suitable for removal,
1226 processing, and final disposition of sediment at the Site. Technologies/process options retained
1227 in this section may be used either alone or integrated with other technologies to provide site wide
1228 remedial alternatives.

1229 The rationales for including or eliminating each technology are described in more detail below.

1230 **3.3.1 Removal**

1231 Several removal technologies applicable to both the Tidal Flats and the OF-008 drainage ditch
1232 were evaluated. These technologies included mechanical dredging², hydraulic dredging,
1233 amphibious dredges, and traditional excavation, as well as ancillary support technologies such
1234 as debris removal, turbidity control, and temporary dams. These technologies are described in
1235 additional detail below and in the Dredging Alternatives Evaluation (**Appendix E**). **Appendix E**
1236 provides a detailed evaluation of hydraulic dredging, precision mechanical dredging, precision
1237 mechanical dredging by hydraulic transport of sediments, amphibious dredging, and long-reach
1238 terrestrial excavation (see **Table 7** of **Appendix E** for a comparison). Technical details associated

² All mechanical dredging discussed in this FFS refers to dredging equipment that utilizes precision level cut sealed environmental dredging buckets and GPS positioning software to ensure accurate removals with low potential for resuspension and residuals generation.

1239 with each of those removal approaches are presented in detail in **Appendix E**, which form the
1240 basis for the screening evaluation presented in this Section.

1241 **3.3.1.1 Mechanical Dredging**

1242 Mechanical dredging is a presumptive remedial technology for contaminated sediments.
1243 Mechanical dredging removes impacted sediments from the area of concern within a waterway
1244 by using direct mechanical force to dislodge and contain the material. Heavy equipment (various
1245 sizes of excavators and cranes) are mounted onto a barge and used to excavate the area of
1246 concern using precise global positioning system (GPS) guided equipment for horizontal and
1247 vertical accuracy. The dredge area can also be dewatered, and the sediment removed
1248 mechanically in a dry environment using sheet pile, Portadam, muscle walls, or Aqua-Barrier®
1249 (see below under “Excavation”). Alternatively, these methods can also be used to keep water
1250 levels high in areas subject to fluctuating water levels (e.g., tidally influenced shallow areas)
1251 allowing water-based equipment to operate throughout the tidal cycle.

1252 Removed sediments are typically placed on a materials barge where they are temporarily
1253 stockpiled to allow water to be collected and treated through a water treatment system. Once the
1254 bulk of the water has been collected, treated and discharged within the environmental barriers,
1255 the sediments are transported to a land transfer facility for additional processing. Sediments are
1256 then further dewatered (if necessary) and then treated with a drying agent (typically Portland
1257 cement) to reduce the moisture content of sediments to an allowable limit and improve strength
1258 and handling characteristics for off-site transportation and disposal. In some cases, sediments
1259 are treated directly within the barge following initial dewatering. The sediments are then conveyed
1260 from the processing facility into barges or trucks for off-site disposal or beneficially re-used on-
1261 site as fill materials. If mechanically dredging in the dry, access roads within the dredge area
1262 would be constructed to allow direct loading of sediments into trucks for hauling to the
1263 processing/disposal area.

1264 Due to Site constraints, a sediment processing and off-loading bulkhead will be required, or an
1265 off-site shipping yard will need to be used for all waterway access, sediment processing,
1266 transportation and disposal. Tide information, bridge clearances, navigation channels, and
1267 underwater utility locations are important considerations in mechanical dredging projects and
1268 must be identified and considered during the remedial design. Proximity to local shipping yards
1269 and coordination with harbor masters is also a consideration during mechanical dredging of
1270 materials.

1271 Mechanical dredging has been retained for further consideration for the Tidal Flats.

1272 The OF-008 drainage ditch has limited water access due to the tidal gate and is very narrow in
1273 certain portions of the ditch making it difficult to navigate a barge. For these reasons, mechanical
1274 dredging has been screened out for OF-008.

1275 **3.3.1.2 Debris and Large Material Removal**

1276 This step is typically required before hydraulic dredging if significant oversize debris or other
1277 objects are present. Removal may also be necessary prior to mechanical dredging depending on
1278 potential for interference with bucket operation. Sediment is first sifted with rakes, grapples, or
1279 an excavator bucket to remove interfering debris which is then and placed on barges. Debris is
1280 then transported to land for further processing and off-site disposal. Removal allows for more
1281 efficient dredging operations.

1282
1283 Debris is not believed to be a significant concern within the Tidal Flats based on observations of
1284 the site and anecdotal information obtained during discussion with on-site maintenance staff who
1285 know site history.

1286
1287 Limited debris removal has been retained for inclusion in the remedial alternatives due to its
1288 potential applicability.

1289 **3.3.1.3 Hydraulic Dredging**

1290 Hydraulic dredging uses mechanical cutting action to dislodge sediment and a pump to create
1291 suction at the dredge head to remove and transport sediment in a slurry form. The dredged
1292 material is usually pumped through a pipeline to a settling lagoon or tank (typically on land).
1293 Environmental dredging using hydraulic dredges typically produces slurries between
1294 approximately 5 and 10% solids by weight. A “cutter head” hydraulic dredge is commonly used to
1295 apply mechanical force to dislodge the sediments for removal by the dredge pump. In some cases
1296 when the sediment is particularly loose, suction alone is sufficient to transport sediments and a
1297 cutter head is not necessary. The slurry requires extensive dewatering and additional process
1298 prior to on-site beneficial reuse or off-site disposal of the dredged materials. This is often
1299 accomplished using settling tanks, mechanical filter presses, Geotubes, and stabilization agents
1300 and may require multiple steps. Water generated during dredging and dewatering of the slurry is
1301 typically treated and discharged back to the dredge area. Hydraulic dredging typically generates
1302 water flow rates 10 to 100 times that of mechanically dredged sediments due to the much lower
1303 percent solids slurry.

1304 Debris can be a concern with hydraulic dredging due to its potential to clog the suction head or
1305 impede cutting action. Significant debris is not expected at the Tidal Flats.

1306 Hydraulic dredging has been retained for further evaluation for the Tidal Flats.

1307 The OF-008 drainage ditch has limited water access due to the tidal gate and is very narrow in
1308 certain portions of the ditch making it difficult to navigate a barge. For these reasons, hydraulic
1309 dredging has been screened out for OF-008.

1310 **3.3.1.4 Mechanical Excavation**

1311 Traditional or specialized low ground pressure excavation equipment can be used to remove
1312 nearshore sediments or sediments that can support heavy equipment with or without constructed
1313 access roads. Standard excavation would occur “in the dry,” i.e., at low tide or when the water
1314 body is in an engineered dewatered condition. Standard reach or long-reach excavation
1315 equipment can be used to access sediments. Traditional equipment is particularly applicable for
1316 the removal of sediments along the perimeter of the Tidal Flats and for the entire length of the
1317 OF-008 drainage ditch.

1318
1319 Traditional excavation has been retained for further evaluation for use along the perimeter of the
1320 Tidal Flats (equipment staged along the dike and Causeway) and the OF-008 drainage ditch
1321 (equipment staged at the top of bank).

1322 **3.3.1.5 Amphibious Dredging**

1323 Specialty amphibious dredging equipment can combine elements of mechanical and hydraulic
1324 dredging and traditional excavation. The advantage of this equipment is its ability to work longer
1325 throughout the tidal cycle on the mud flats. However, because of the potential to generate
1326 excessive turbidity and the soft nature of the sediments, amphibious dredging has been screened
1327 from further consideration.

1328 **3.3.1.6 Temporary Dams**

1329 These technologies include both pre-packaged available proprietary systems (e.g., Portadam,
1330 AquabARRIER®, and Muscle Wall) and site-specifically engineered systems (sheet pile walls or
1331 earthen dams). These structures are installed within waterways to control water, either to keep
1332 water levels high (e.g., to allow mechanical dredging in areas subject to tidal fluctuations), or to
1333 keep water levels low (e.g., to allow excavation in the dry either in the Tidal Flats or for the OF-008
1334 drainage ditch). Proprietary systems offer the advantage that they are easily deployed and require
1335 little engineering; however, these systems are feasible only in limited circumstances – water
1336 depth, current, wave action, or tidal fluctuation all impact their applicability.

1337
1338 Alternatively, engineered systems such as sheet pile and earthen berms can be scaled to almost
1339 any size and configuration to handle a much wider variety of site conditions including deeper
1340 water, currents, tides, and wave action.

1341
1342 Therefore, only sheet pile (Tidal Flats and OF-008) and earthen dams (OF-008) have been
1343 retained for further evaluation.

1344 **3.3.1.7 Engineering Controls**

1345 Additional engineering controls are typically required for dredging projects. Turbidity barriers,
1346 wave attenuators, and fish barriers have been identified as relevant to operations at the SAEP.
1347 Turbidity barriers include both silt curtains and harder structures such as cofferdams. A full-length
1348 silt curtain (Type II or Type III) would be appropriate to contain resuspended sediments and

1349 manage water quality impacts. Properly installed and maintained silt curtains can be very
1350 effective at reducing water quality impacts.

1351
1352 An installed sheet pile cofferdam would essentially eliminate the possibility of resuspended
1353 sediment from leaving the work area through complete physical separation. The sheet pile
1354 cofferdam would be installed to completely enclose the work area, beginning in a line parallel to
1355 the breakwater, and running just outside of the work zone beyond the Causeway, and then
1356 terminating at shore to the east of the Causeway.

1357
1358 Wave attenuators dissipate the energy from wave action entering the work zone, from either
1359 vessel induced wake or wind driven waves. These structures allow the dredge plant to operate
1360 more efficiently by reducing the wave impacts on the dredge and appurtenant equipment.

1361
1362 These technologies are all retained for further evaluation for the Tidal Flats. Sheet pile cofferdams
1363 have been retained to segregate work areas and control water at OF-008.

1364
1365 **3.3.2 Material Transport**

1366 Several modes of transportation of removed sediment are applicable, including barge transport,
1367 pneumatic flow tube mixing (PFTM), hydraulic slurry transport, and truck transport.

1368 **3.3.2.1 Barge/Scow**

1369 A barge/scow is a flat-bottomed boat with a rectangular hull that is used to decant, store, and
1370 transport mechanically dredged sediments. During mechanical sediment removal, a barge/scow
1371 is kept near the mechanical dredge barge and dredged sediment is placed in the adjacent
1372 barge/scow. Water is then decanted from the sediment within the dredge footprint. Once the
1373 barge/scow is full it is transported to the off-loading facility for sediment removal and returned to
1374 the dredging area to be reloaded.

1375 In addition, barge transport can be used to transport sediments directly to an off-site sediment
1376 processing facility following dredging. This method avoids the need to build significant on-site
1377 infrastructure for sediment processing. There are several sediment processing facilities operating
1378 within the greater New York/New Jersey area that are within an economically feasible transport
1379 distance. Following transport to the off-site sediment processing facility, sediments are off-loaded
1380 and further processed as necessary in accordance with facility permits and transported via truck
1381 or rail to off-site permitted locations for either disposal in a landfill or beneficial reuse. Clean Earth
1382 operates several of these types of processing facilities Kearny, Carteret, and Jersey City, NJ.

1383 Barge transport has been retained for further evaluation for the Tidal Flats. The OF-008 drainage
1384 ditch has limited water access due to the tidal gate and is very narrow in certain portions of the
1385 ditch making it difficult to navigate a barge. For these reasons, barge transport has been screened
1386 out for OF-008.

1387 **3.3.2.2 Pneumatic Flow Tube Mixing**

1388 In PFTM, dredged sediment is first placed in a hopper barge, and then fed into a transport pipe
1389 where the sediment is pushed along in “plugs” by pockets of air pumped into the pipeline. An
1390 injection port is used to inject a Portland cement slurry into the moving sediment. The amendment
1391 (typically Portland cement) and sediment mix within the transport pipe through the agitation
1392 created by the pneumatic pumping. The mixed sediment and cement are then discharged to
1393 selected locations for final placement for beneficial reuse on-site.

1394 This material transport method reduces the need for upland processing of sediment and creates
1395 a more stable material with significant strength that can be used in various capacities as fill
1396 material on site. PFTM also reduces or eliminates the need for water treatment. There is only
1397 one known commercially viable vendor for this process on the East Coast, known as Tipping Point
1398 Resources Group (TPRG), LLC. TPRG has been permitted to operate a PFTM system in the New
1399 Haven area, coupled with the disposal of treated sediments at permitted sites within the state of
1400 CT. TPRG would mobilize their equipment to the project Site to set up a similar operation for on-
1401 site placement of material.

1402 PFTM is retained for further evaluation for the Tidal Flats. Due to the available landside access
1403 of the OF-008 remediation footprint, PFTM has been screened out for OF-008.

1404 **3.3.2.3 Hydraulic Material Transport**

1405 Hydraulic material transport efficiently moves low solids content slurry from a sediment barge or
1406 directly from a hydraulic dredging operation. The sediment is high in water content allowing it to
1407 be pumped from the waterside to the landside through a series of pipe and pump networks.
1408 Hydraulic material transport can be used with mechanical or hydraulic dredging applications.

1409 Hydraulic transport has been retained for further evaluation for the Tidal Flats. Due to the
1410 available landside access of the OF-008 remediation footprint, hydraulic transport has been
1411 screened out for OF-008.

1412 **3.3.2.4 Truck Transport**

1413 Truck transport is potentially viable for several applications at the SAEP. Trucks can be used to
1414 haul mechanically dredged sediments off-loaded from a barge to a land-based sediment
1415 processing area. Truck transport is also viable for hauling sediments excavated from the shallow
1416 perimeter of the Tidal Flats accessed by a standard excavator or for the OF-008 drainage ditch.
1417 If dredging is completed in the dry, access roads can be built to allow low pressure equipment to
1418 drive onto the sediment and be directly loaded from a mechanical dredge or excavator. This type
1419 of material transport can be highly disruptive if building roads in soft sediments; therefore, truck
1420 transport within the tidal flats has been eliminated from further consideration.

1421 Truck transport is necessary for the off-site hauling of processed sediment to off-site disposal
1422 facilities.

1423 Land based truck transport from the off-loading bulkhead to the dewatering and processing area
1424 has been retained for further evaluation in conjunction with mechanically dredged sediments in
1425 the Tidal Flats and sediment excavated via standard excavation equipment in OF-008. Truck
1426 transport is also retained for sediment hauling to off-site disposal facilities.

1427 **3.3.3 Sediment Dewatering and Processing**

1428 There are several types of processing and dewatering technologies available to process sediment
1429 that is dredged either mechanically or hydraulically. Dewatering technologies include gravity
1430 dewatering, mechanical dewatering processes, and filter bag dewatering. Mechanical dewatering
1431 processes typically include steps for size separation to remove oversize material from the slurry
1432 prior to processing within the mechanical dewatering equipment.

1433 **3.3.3.1 Gravity Dewatering**

1434 Dredged sediment is placed into a barge or on a dewatering pad for a period of time to allow water
1435 to drain out via gravity. Gravity dewatering, therefore, is the least complex of the dewatering
1436 technologies and requires the least amount of preparation and pre-processing. Sediments that
1437 are mechanically dredged are typically near or slightly above their natural in situ moisture content.
1438 Sediment can be gravity dewatered on a barge as a first dewatering step followed by gravity
1439 dewatering on land. This method can be particularly effective for coarser materials such as sand,
1440 which do not typically require any additional processing following gravity dewatering. Silty
1441 material or material high in organic content may not drain sufficiently and may require the addition
1442 of amendments such as Portland cement to eliminate free water.

1443
1444 Gravity dewatering has been retained for further evaluation for both Tidal Flats and OF-008
1445 sediments.

1446 **3.3.3.2 Mechanical Dewatering**

1447 Mechanical dewatering technologies include a wide variety of techniques to dewater sediment
1448 that is hydraulically transported at fairly low percent solids (2 to 20% solids). These techniques
1449 typically require complex treatment process systems to separate out various larger material sizes
1450 (that can be gravity drained) before the remaining fine material is dewatered. Oversize material
1451 (debris, rocks, gravel, and sand) must be screened out. This can be accomplished through a
1452 variety of methods, including settling basins, bar screens, augers, progressively finer screens,
1453 vibrating screens, hydrocyclones, and clarifiers, all designed to generate a slurry containing only
1454 fines that can be processed in mechanical dewatering equipment. Several proprietary processes
1455 combine these elements into a complete system that produces fine dewatered sediments,
1456 oversize material, and clarified or filtered water. Equipment from the mining and shale industries
1457 have been adapted for use in sediment dewatering. The water generated by these processes
1458 may or may not require further treatment before discharge back to the original water body. The
1459 dewatered sediments typically have been dewatered to a moisture content that is low enough to

1460 pass the paint filter test, allowing the material to be transported off-site for re-use or disposal or
1461 for placement on-site as fill material.

1462

1463 The following subsections describe the more commonly available technologies for mechanical
1464 dewatering.

1465 **3.3.3.2.1 Belt Press**

1466 A belt filter press uses a series of mesh fabrics and rollers to squeeze the sediment slurry,
1467 producing a filtrate liquid and a sediment filter cake at high percent solids. A coagulant polymer
1468 is often added to the slurry prior to the belt filter press to aid in the dewatering process, allowing
1469 the solids to more effectively coalesce and create the filter cake. As the sediment slurry is
1470 processed through the belt filter press, the rollers typically decrease in radial size, increasing the
1471 pressure on the sediment and increasing its percent solids. The filtrate squeezed from the solids
1472 is collected for further treatment and disposal. A solid sediment cake is collected at the end of
1473 the belt press and stockpiled for further processing, beneficial reuse on site, or disposal off-site.

1474 Belt press technology has been retained for further evaluation for the Tidal Flat sediment
1475 dewatering and eliminated for OF-008. OF-008 sediments are proposed to be excavated in the
1476 dry which will result in much higher percent solid material which can be gravity drained and
1477 stabilized with Portland cement.

1478 **3.3.3.2.2 Recessed Chamber Filter Press**

1479 The recessed chamber filter press machine uses a series of plates (typically polypropylene)
1480 mounted on a steel frame to squeeze the sediment slurry at high pressure to drive water out of
1481 the sediment. The plates have a concave depression and hole in the middle to create a chamber
1482 for squeezing the sediment. A filter cloth lining between each of the plates filters the expressed
1483 liquid as it is generated. Processing is in batches, with filter cake generated on a certain time
1484 cycle. Like other mechanical dewatering technologies, the addition of polymers to the slurry can
1485 enhance the dewatering process through coagulation.

1486 Recessed chamber filter press has been retained for further evaluation for the Tidal Flat sediment
1487 dewatering and eliminated for OF-008. OF-008 sediments are proposed to be excavated in the
1488 dry and gravity dewatered, followed by sediment stabilization with Portland cement.

1489 **3.3.3.2.3 Centrifuge**

1490 The centrifuge separates solids and water by taking advantage of centrifugal force and differential
1491 densities. The sediment/water slurry is spun at high (4,500) revolutions per minute along a
1492 horizontal axis, causing the heavier solids to separate from the water in the slurry. The solids and
1493 water are drawn off separately. Centrifuges are complex machines with many moving parts
1494 operating at high speeds. Like other mechanical dewatering processes, polymers typically
1495 enhance the separation of solids and water. A technology that is similar, but more passive with
1496 less moving parts, is the hydrocyclone. This technology operates on the same principal of
1497 centrifugal force as the centrifuge. Hydrocyclones can be used in conjunction with centrifuges
1498 and other mechanical dewatering systems.

1499 Centrifuge technology has been retained for further evaluation for the Tidal Flat sediment
1500 dewatering and eliminated for OF-008. OF-008 sediments are proposed to be excavated in the
1501 dry and gravity dewatered, followed by sediment stabilization with Portland cement.

1502 **3.3.3.2.4 Proprietary Mechanical Dewatering Systems**

1503 There are many proprietary complete dewatering systems available commercially. These systems
1504 include a combination of the technologies described above to provide a complete solution to
1505 dewater sediment. Examples of these processes include Hi-G by Derrick (a series of vibratory
1506 screens that rotate elliptically rather than linearly, generated higher forces for screening, and
1507 hydrocyclones), the Genesis Rapid Dewatering System (proprietary Aquascreen® and capillary
1508 action), and the TCW-3000 Plus by DEL Tank and Filtration Systems (vibrating screens and
1509 hydrocyclones).

1510 For purposes of this FFS, the Hi-G screening system was selected for further evaluation as part
1511 of the Treatability Study; however, upon coordination with the vendor (Derrick), Derrick could not
1512 accept material with PCB concentrations present and declined to perform the treatability study
1513 (**Appendix C, Section 7.1**). However, ultimately any of these process options (whole systems)
1514 could potentially provide effective dewatering. The selected system for dewatering may depend
1515 on the selected dredging contractor's preferences and equipment availability.

1516 **3.3.3.3 Geotubes**

1517 Geotube dewatering containers are large diameter fabric tubes that filter low percent solids
1518 slurries to create materials with higher percent solids that can in turn be beneficially re-used or
1519 disposed of. Prior to being pumped into the Geotubes, the hydraulically conveyed sediment slurry
1520 is treated with coagulant polymers to aid in particulate filtration, similar to other slurry dewatering
1521 applications. One advantage of Geotubes is that little or no size separation is needed prior to
1522 Geotube dewatering; therefore, hydraulically conveyed sediments can generally be pumped
1523 directly into Geotubes. Initial filtration of the solids occurs through pressure generated from
1524 pumping the slurry into the tubes, followed by secondary filtration driven by the force of gravity
1525 over a longer period, which can typically be 30 to 45 days or longer. The filtered water is drained
1526 and collected for further treatment, leaving the solids within the Geotubes. When full, the
1527 Geotubes can remain on-site for beneficial reuse in the as-delivered location or the dried solids
1528 can be hauled off-site for disposal at a landfill or beneficial re-use.

1529 Geotubes have been retained for further evaluation for the Tidal Flat sediment dewatering.
1530 OF-008 sediments are proposed to be excavated in the dry and gravity drained, followed by
1531 sediment stabilization with Portland cement, making Geotubes not applicable.

1532 **3.3.3.4 Solidification and Stabilization**

1533 Solidification and stabilization (S/S) include the physical improvement of the sediment for
1534 workability, transport, and placement and chemical fixation to reduce the potential for leaching of
1535 site contaminants. These two processes typically work in conjunction with each other and can be
1536 used with either hydraulic or mechanical dredge operations. Dewatered sediment is transported
1537 to the processing area where a certain amount (depending on the type of sediment and objectives

1538 of S/S) of additive (typically Portland cement) is mixed into the sediment, completing the
1539 dewatering process, solidifying the sediment, and reducing leachability of contaminants. Once
1540 solidified, the sediment can be transported by truck off-site, or stockpiled and reused on-site.
1541 Depending on the requirements of the off-site facility or on-site beneficial reuse, strength of the
1542 sediment may be an important consideration. Additives such as Portland cement and lime are
1543 typical to achieve moisture reduction, chemical fixation, and strength improvement.

1544 S/S can be implemented using traditional excavator bucket mixing, pug mill mixing, dual or single
1545 axis mixer head application, or PFTM.

1546 S/S has been retained for further evaluation for both the Tidal Flats and OF-008.

1547 **3.3.3.5 Wastewater Treatment Technologies**

1548 There are a wide variety of technologies available to treat dewatering fluids generated from
1549 sediment dewatering. These technologies include settling, pH adjustment, coagulant and
1550 flocculent addition, metals precipitation, filtration, carbon adsorption, ion exchange, reverse
1551 osmosis, and other specialty media treatment. The required treatment train can be simple, or
1552 complex depending on the influent water quality and required discharge standards. At a
1553 minimum, settling, filtration, and carbon adsorption are likely to be applicable to the SAEP site
1554 based upon the presence of various metals and PCBs.

1555
1556 Wastewater treatment technologies have been retained for further evaluation.

1557 **3.3.4 Disposal/Re-Use**

1559 **3.3.4.1 Confined Disposal Facility**

1560 A confined disposal facility (CDF) is an approved upland area typically located along the shoreline
1561 for placement of dredged materials. Dredged material is placed directly in the CDF and allowed
1562 to dewater by gravity drainage or pumped to Geotubes for dewatering within the CDF. Dewatering
1563 fluid may require additional treatment before discharge. Typically, these areas are contained
1564 within sheet pile enclosures which become permanent features and may be used as an additional
1565 shoreline resource (e.g., for recreational or commercial purposes) upon completion.

1566
1567 Two options have been considered for implementation at the SAEP. One option would include
1568 essentially straight walls that would “square off” the curved shoreline of the existing Tidal Flats.
1569 This would create significant shoreline encroachment below the high tide line, reducing the Tidal
1570 Flats area. This option has been screened out due to numerous regulatory and ecological
1571 concerns.

1572
1573 Another configuration would be a shoreline CDF constructed parallel to the shoreline all the way
1574 around the Causeway at the high tide line to minimize the impacts to the Tidal Flats. This
1575 configuration is more acceptable to regulators and would potentially provide benefits for future
1576 development.

1577

1578 The shoreline CDF constructed parallel to the shoreline has been retained for further evaluation
1579 for the Tidal Flats. To eliminate future liability and long-term monitoring and maintenance for the
1580 U.S. Army, a key component of this technology would be to permanently transfer long-term liability
1581 to the future owner of the upland property. The shoreline CDF is also applicable to sediments
1582 removed from the OF-008 drainage ditch.

1583 **3.3.4.2 Confined Aquatic Disposal Cell**

1584 Confined Aquatic Disposal (CAD) cell placement involves the transport of dredged materials to
1585 an approved open-water location which has been dredged to create a cell for the contaminated
1586 materials. The contaminated sediments are then placed in the CAD cell. The material can be
1587 hydraulically pumped to the CAD or placed mechanically from a barge or released from a split
1588 hull hopper barge. The material is placed into the CAD cell in this manner until its capacity is
1589 reached. Once capacity is reached, the CAD cell is capped. Capping of the CAD cell would be
1590 similar in design as capping that has been described above as a containment GRA. Capping is
1591 intended to isolate the contaminated dredged materials to prevent environmental impacts.

1592
1593 Two CAD cell locations near the site within the Housatonic River and at the site were evaluated
1594 for potential applicability to the project and inclusion in the remedial alternatives.

1595
1596 CAD cell construction has been retained for inclusion in remedial alternatives for both Tidal Flats
1597 and OF-008 sediments.

1598 **3.3.4.3 On-Site Beneficial Reuse**

1599 The entire SAEP site is within a floodplain; therefore, the SAEP requires approximately 7 ft of fill
1600 to be placed across the site to make the site developable. For this reason, the on-site beneficial
1601 reuse of sediments is a potential option for disposition of dredged material. For the material to be
1602 acceptable for on-site use, it must meet physical and chemical requirements. The chemical
1603 requirements for land disposal of treated sediment include meeting appropriate groundwater
1604 protection standards as measured through the Toxicity Characteristic Leaching Procedure
1605 (TCLP) (EPA Method 1311) or Synthetic Precipitation Leaching Procedure [SPLP] test (EPA
1606 Method 1312). Treatability results of raw sediment, dewatered sediment, and sediments treated
1607 with S/S agents all show the sediment to meet GW B standards (the site is zoned GW B which
1608 includes industrial process water and cooling water uses etc., not suitable for human
1609 consumption, CT DEEP 2017) as measured via the SPLP test (Appendix B to RSRs, CT DEEP
1610 2013). For the Pollutant Mobility Criteria cited in the CT RSRs (Section 22a-133k-3), the method
1611 of measurement is the SPLP or TCLP test methods, which is the method performed on treated
1612 and untreated site sediments for purposes of this comparison. **Table C-8 of Appendix C**
1613 (Treatability Testing Evaluation) presents the SPLP results and a comparison to state GWB
1614 standards.

1615 Regarding physical characteristics of the processed sediment, it is not currently possible to
1616 identify a final or exact on-site disposal area that will meet future unknown redevelopment plans
1617 and requirements. The currently available site development plan is highly conceptual at this stage
1618 and subject to numerous changes based on market demand and input from various local

1619 stakeholders. Therefore, establishing material physical properties that meet the intended future
1620 uses is difficult at this stage.

1621 However, based on a review of similar sites that require the solidification of sediments or
1622 subsurface soils, generally the unconfined compressive strength (UCS) (ASTM D1633) test is
1623 used as a basis for specifications. Typically, material strengths ranging from 40 to 80 pounds per
1624 square inch (psi) are required for most development uses. For comparison purposes, concrete
1625 has a UCS of 3,000 psi or greater. Generally, soil or treated sediment becomes un-excavatable
1626 at 200 psi or greater. Materials below 100 psi in strength are generally workable and can be
1627 removed and re-compacted as necessary to support development requirements, like other soil
1628 materials used for various development purposes.

1629 In treatability testing performed on Site sediments, UCS results of 5.5, 61, and 90 psi were
1630 obtained on gravity-drained sediments for additive ratios of 2%, 4%, and 5% Portland cement,
1631 respectively, and 8.8, 108, and 91 psi were obtained on belt pressed dewatered sediments treated
1632 with 3%, 6%, and 8% Portland cement, respectively. During initial curing at days 1, 3, and 5, both
1633 torvane and pocket penetrometers readings were obtained. For belt press dewatered sediments
1634 amended with Portland cement, pocket penetrometer results developed to 0.25 tons per square
1635 foot (TSF) (3%) and >4.5 TSF (6% and 8%) after five days. Torvane results show strength
1636 development of 2.8 to 5.5 (torvane results are reported in kg/cm² [kgc2]).

1637 For gravity drained sediments, pocket penetrometer results yielded 0.5 to >4.5 TSF and torvane
1638 results ranged from 2 to 3.5 kgc2. In general, the pocket penetrometer and torvane tests provided
1639 verification of the cement curing process in the early days following mixture development.

1640 For the Mintek Calciment results, pocket penetrometer and torvane results were much lower, as
1641 expected, and were 0.25 TSF for all belt press dewatered mixtures and 1 to 2.5 kgc2 for the
1642 torvane tests. Similarly, for gravity drained sediments, pocket penetrometer results ranged from
1643 0.0 to 0.5 TSF and 0 to 2 kgc2 for torvane (see **Appendix C** subsection 7.3 and Kemron
1644 treatability report for more details).

1645 Similarly, sediments solidified using a bench-testing process designed to mimic the PFTM
1646 process yielded results ranging from 81 to 170 psi for Portland cement additive ratios ranging
1647 from 6% to 14%. In conclusion, the addition of 6% Portland cement is believed to be sufficient for
1648 likely on-site beneficial re-use requirements (see **Appendix C** Section 7.3 Solidification, Section
1649 8 Tipping Point Treatability Study, and **Appendix C Attachment C**).

1650 Once the sediment has been processed and meets the required geotechnical parameters for re-
1651 use it can be placed as fill as needed on-site. For purposes of this FFS, a generic stockpiling area
1652 has been assumed for processed sediment. It is important to note that the above strengths are
1653 not necessary to simply create a stockpile of dewatered sediment for future use.

1654 On-site beneficial re-use has been retained for further evaluation for both the Tidal Flats and
1655 OF-008.

1656 **3.3.4.4 Off-Site Disposal and Beneficial Reuse**

1657 Off-site disposal of sediments includes disposal at both RCRA C/TSCA-permitted facilities and
1658 RCRA D landfill facilities. All sediments from the Site have been assumed to be non-RCRA (listed
1659 or characteristic). There is no site history that would link the use of RCRA listed processes to
1660 sediment contamination. Therefore, the sediments are not considered a listed hazardous waste.
1661 To determine if the waste could be a characteristic hazardous waste, hazardous waste parameter
1662 analyses were completed. TCLP analysis of raw and treated sediment was conducted. Results
1663 show that the sediment does not fail the toxicity characteristic (“D” waste codes, see Appendix C,
1664 **Table C-9**). Furthermore, other hazardous waste parameters, ignitability, reactivity, and
1665 corrosivity all show that the sediment does not exhibit hazardous waste characteristics. Therefore,
1666 it is assumed that all sediment can be disposed of in RCRA Subtitle D (solid waste) landfills.

1667 However, given the presence of PCBs in the sediment, the Toxic Substances Control Act (TSCA)
1668 must be considered for on-site handling and off-site disposal considerations. For off-site sediment
1669 disposal, RCRA D landfills do not accept soils containing PCB concentrations equal to or greater
1670 than 50 ppm. In addition, the operating permits of many state-permitted landfills and Treatment,
1671 Storage and Disposal Facilities (TSDFs), including asphalt batch plants and thermal incinerators
1672 may limit PCB concentrations at lower levels. This will limit the number of landfills or facilities
1673 permitted to accept the processed sediment and may increase the cost for disposal.

1674 Once the sediment has been sufficiently processed and has been accepted by the off-site
1675 disposal facility, it will be loaded into trucks, rail cars, or barges and disposed of off-site.

1676 Sediment meeting beneficial reuse criteria may be reused off-site as landfill daily cover or road
1677 base material, urban fill, or for other uses including mine and site reclamation depending on the
1678 chemical characterization of the sediment and the permitting requirements of the site. The
1679 potential for reuse of the sediments off-site will need to be determined at the time of contractor
1680 bidding for the project, as these options can change over time.

1681 Off-site disposal has been retained for further evaluation as an alternative disposal option for both
1682 the Tidal Flats and OF-008.

1683 **3.3.5 Habitat Restoration**

1684 The following restoration options are applicable to various areas of the site and would be
1685 implemented following remediation.

1686 **3.3.5.1 Bank Treatments/Bioengineering**

1687 Banks along rivers and streams require hard and soft structures to ensure they are stable and
1688 allow vegetation to re-establish itself. The structures or materials include coir fabrics and logs,
1689 native vegetation, rip rap, placement of trees, and other bank features to replicate desired
1690 conditions.

1691 **3.3.5.2 Riparian Vegetation**

1692 Potentially applicable to the OF-008 drainage ditch, replanting of vegetation along the banks of
1693 rivers and streams is an essential component of reestablishing a water body's function. This
1694 method re-establishes trees, shrubs, forbs, grasses, and sedges as appropriate to recreate the
1695 desired ecosystem.

1696 **3.3.5.3 Tidal Salt Marsh**

1697 A saltmarsh is a coastal ecosystem in the upper coastal intertidal zone between land and open
1698 saltwater or brackish water that is regularly flooded by the tides. Tidal salt marsh restoration will
1699 be completed for areas of the tidal mudflats and in the OF-008 remediation area (if present) once
1700 the sediments are removed. There are several acres of high salt marsh present within the tidal
1701 mudflats. These areas are located towards the northern limits of the Tidal Flats inside the
1702 breakwater and along the western shoreline of the mudflats adjacent to the hurricane dike. Similar
1703 soil material will be replaced and planted with salt marsh grass to reestablish habitat.

1704 **3.3.5.4 Tidal Mudflats**

1705 Tidal mudflats are coastal wetlands that accumulate mud deposited by tides. Most of the sediment
1706 within a mudflat is within the intertidal zone, and thus the flat is submerged and exposed
1707 approximately twice daily. The tidal mudflats will be backfilled to elevations that are one foot
1708 below the existing mudline using a sandy material to enhance the restoration process. The
1709 remaining one foot of material is assumed to be re-deposited by natural processes over time and
1710 will allow for the top foot of material to be similar in grain size to existing conditions.

1711

1712 An evaluation of LiDAR survey data collected between 2006 and 2015 (see **Appendix A-4**) for
1713 the Tidal Flats area clearly demonstrates that the mean sediment elevation of the flats
1714 increased by 0.39 feet over the 9-year period. This sedimentation occurred despite the impacts
1715 of Hurricane Sandy in late October 2012, which was estimated to have potentially decreased
1716 the mean elevation of the flats by as much as 0.28 feet. Using the LiDAR data for the 2012
1717 (post-"Sandy") and 2015, an estimated sedimentation rate of 0.07 feet/year was calculated;
1718 using this rate it is theorized that the remaining one foot of excavation that is not intended to be
1719 backfilled will require 14 years to accumulate sediment through natural processes. However, it
1720 is important to note that this time estimate is likely a maximum value. The 1-foot removal depth
1721 areas which are not planned to be backfilled to existing grade represent non-equilibrium
1722 conditions for the mudflats, and as such will result in an accelerated sedimentation rates in
1723 those areas. Increases in sedimentation rates have been documented at other sediment
1724 excavation sites where excavations have not been completely backfilled to grade
1725 (<http://www.nae.usace.army.mil/Portals/74/docs/DAMOS/TechReports/186.pdf>). Although it is
1726 difficult to quantitatively estimate the impact of the non-equilibrium condition on the
1727 sedimentation rate, it is possible that the timeframe to naturally backfill the 1-foot interval to
1728 existing grade will be less than 14 years and may be on the order of +/-10 years.

United States Army Corps of Engineers, New England District
Stratford Army Engine Plant, Stratford, CT
Final Focused Feasibility Study

1729 Due to the documented net sedimentation occurring on the Tidal Flats, over a time period
1730 encompassing storm impacts from Hurricane Sandy, long-term monitoring of the restoration
1731 outside of re-vegetated areas is considered unnecessary and will not be conducted.

1732 4.0 DEVELOPMENT AND SCREENING OF ALTERNATIVES

1733 In this section, technically feasible technologies retained following screening in Section 3.0 are
1734 combined to form remedial action alternatives that may be applicable to the Tidal Flats and the
1735 OF-008 drainage ditch at the SAEP.

1736 The alternatives are developed to meet the RAOs presented in Section 2.4, using the GRAs
1737 identified in Section 3.1 either singly or in combination. Developed remedial alternatives are then
1738 screened with respect to the criteria of effectiveness, implementability, and cost in accordance
1739 with the requirements of CERCLA and the NCP. Cost is not formally evaluated in this section.
1740 Rather, based on knowledge of relative costs, professional judgment is used to identify the relative
1741 cost-effectiveness of each alternative. Detailed cost evaluations are presented in Section 5.0 as
1742 part of the detailed evaluation of alternatives passing this section's screening.

1743 The objective of the alternative screening step is to eliminate impractical alternatives or higher
1744 cost alternatives that are not considered cost-effective (i.e., that provide little or no increase in
1745 effectiveness or improvement in implementability over their lower-cost counterparts). The
1746 effectiveness and implementability criteria used for screening the alternatives are defined below.

1747 **Effectiveness.** Each alternative is evaluated for its ability to protect human health and the
1748 environment, including the extent to which toxicity, mobility, or volume of contaminants is reduced.
1749 Both short- and long-term effectiveness are considered. Short-term effectiveness involves the
1750 extent to which existing risks to receptors during the construction and implementation period are
1751 reduced, identifying and mitigating expected effects to the environment during construction and
1752 implementation, the alternative's ability to meet RAOs, and the relative time frame required to
1753 achieve RAOs. Long-term effectiveness, which applies after RAOs have been attained, considers
1754 the magnitude of the remaining residual risk due to residual contaminant sources, and the
1755 adequacy and reliability of specific technical components and control measures to maintain
1756 compliance with RAOs over the life of the remediation.

1757 **Implementability.** Each alternative is also evaluated in terms of technical and administrative
1758 feasibility. In the assessment of short-term technical feasibility, availability of a technology for
1759 construction or mobilization and operation, as well as compliance with action-specific ARARs
1760 during the remedial action, are considered. Long-term technical feasibility considers the ease of
1761 operation and maintenance (O&M), technical reliability, the ease of undertaking additional
1762 remedial actions, and the degree of monitoring of technical controls for residuals and untreated
1763 wastes. Administrative feasibility for implementing a given technology addresses coordination
1764 with other agencies, public acceptance, and the commercial availability of required services and
1765 trained specialists or operators.

1766 **Table 4-1** highlights each alternative's advantages and disadvantages with respect to
1767 effectiveness, implementability, and relative cost. Based on this table, a decision is made to either
1768 retain the alternative for detailed analysis or eliminate it from further consideration.

1769 Consistent with USEPA guidance (USEPA 1988), a No Action Alternative was developed for the
1770 Tidal Flats and OF-008; however, these options have not been carried forward to the detailed

1771 analysis based on the U.S. Army's preference for complete removal of sediments exceeding
1772 PRGs.

1773 **4.1 Development of Alternatives**

1774 Remedial alternatives are developed in this subsection for the Tidal Flats and OF-008 drainage
1775 ditch at the SAEP. A total of eleven alternatives for the Tidal Flats, and three alternatives for the
1776 OF-008 drainage ditch have been developed, including the No Action Alternative for each. The
1777 alternatives consider the following key elements of the sediment remediation process:

- 1778 • the required removals (location and depth) and methods for removal;
- 1779 • available site infrastructure for support and processing;
- 1780 • affected media and methods for dewatering and other processing of sediment;
- 1781 • contaminant type and distribution;
- 1782 • tidal cycles;
- 1783 • control, treatment, and sampling of discharge water; and
- 1784 • control of resuspended sediments.

1785 In assembling these alternatives, GRAs and process options chosen to represent the various
1786 technology types are combined to form alternatives for the site. Alternatives were developed to
1787 provide a range of options consistent with USEPA RI/FS guidance (USEPA, 1988).

1788 In addition, treatability studies have been completed to support the development, screening, and
1789 analysis of alternatives. Results of the treatability testing are provided in **Appendix C** and include
1790 work conducted by Wood and its laboratory subcontractors, ESI of Hampton NH, Alpha Analytical
1791 of Mansfield, MA, Rutgers Weeks Geotechnical Laboratory in Piscataway, NJ, and Kemron
1792 Environmental Services in Atlanta, GA. Treatability tests and other laboratory analyses
1793 completed to support these evaluations include:

- 1794 ▶ Modified elutriate analysis to support water treatment and discharge evaluations (see
1795 **Tables C-3, C-4, and C-5**);
- 1796 ▶ SPLP and TCLP analysis of raw sediments to support evaluation of on- and off-site
1797 disposal and the need for sediment stabilization for purposes of chemical fixation
1798 (**Table C-8**, SPLP and TCLP results);
- 1799 ▶ Grain size, hydrometer, and organic carbon content to assess the materials dredging
1800 and dewatering characteristics (**Tables C-6 and C-7**);

- 1801 ▶ Geotechnical parameters including bulk and dry density, specific gravity, Atterberg
1802 limits, and moisture content to provide general physical characteristics of the material
1803 and support dredge evaluations (**Tables C-6** and **C-7**);
- 1804 ▶ Strength testing of solidified sediments, including pocket penetrometer, torvane, and
1805 unconfined compressive strength (**Appendix C**, Attachment C, Kemron Treatability
1806 Study);
- 1807 ▶ Waste characterization analyses to support ultimate disposition of the material for
1808 on-site beneficial reuse or off-site disposal (**Tables C-9**, **C-10**, and **C-11**); and
- 1809 ▶ Dewatering, solidification, and water treatment tests to identify appropriate methods
1810 for treatment, processing, and disposal/discharge, support cost estimate development,
1811 and determine suitability for on-site re-use of dredged materials (**Tables C-12** through
1812 **C-18**).

1813 **Tables C-1** and **C-2** of Appendix C summarize the sampling performed for treatability testing.
1814 **Figure C-1** shows the locations of sampling points for treatability testing and **Section 1.0** of
1815 **Appendix C** describes the sampling program.

1816 **4.2 Tidal Flats Alternatives**

1817 Eleven remedial alternatives (including No Action) are identified in this subsection to address
1818 RAOs for the sediment in the Tidal Flats. These alternatives and their key components are the
1819 following:

- 1820 ▶ **Alternative 1: No Action**
- 1821 ▶ **Alternative 2: Hydraulic Dredging**
- 1822 ▶ Hydraulic dredging
- 1823 ▶ Turbidity monitoring, management, and engineering controls (silt curtain)
- 1824 ▶ Land-based Long-stick excavation of near shore sediments
- 1825 ▶ Hydraulic slurry transport
- 1826 ▶ Dewatering via belt filter or Geotube
- 1827 ▶ S/S to meet on-site re-use requirements
- 1828 ▶ Water treatment and discharge back to Housatonic River
- 1829 ▶ Mechanically placed backfill
- 1830 ▶ Off-site disposal of sediments containing 1.0 mg/kg PCBs or greater

- 1831 ▶ On-site beneficial re-use or off-site disposal of sediments with less than 1.0 mg/kg
- 1832 PCBs

- 1833 ▶ **Alternative 3: Mechanical Dredging**

- 1834 ▶ Mechanical dredging

- 1835 ▶ Turbidity monitoring, management, and engineering controls (silt curtain) to control
- 1836 turbidity

- 1837 ▶ Land-based long-stick excavation of near shore sediments

- 1838 ▶ Mechanical off-loading of mechanically dredged sediment and truck transport of
- 1839 sediment to processing area

- 1840 ▶ Gravity dewatering

- 1841 ▶ S/S of dewatered sediments to meet on-site re-use requirements or off-site
- 1842 disposal acceptance criteria

- 1843 ▶ Water treatment and discharge back to Housatonic River

- 1844 ▶ Mechanically placed backfill

- 1845 ▶ Off-site disposal of sediments containing 1.0 mg/kg PCBs or greater

- 1846 ▶ On-site beneficial re-use or off-site disposal of sediments with less than 1.0 mg/kg
- 1847 PCBs

- 1848 ▶ **Alternative 4: Mechanical Dredging with Hydraulic Transport**

- 1849 ▶ Mechanical dredging

- 1850 ▶ Turbidity monitoring, management, and engineering controls (silt curtain) to control
- 1851 turbidity

- 1852 ▶ Land-based long-stick excavation of near shore sediments

- 1853 ▶ Hydraulic slurry transport and truck transport of sediments to processing area

- 1854 ▶ Dewatering via belt press

- 1855 ▶ S/S to meet on-site re-use requirements

- 1856 ▶ Water treatment and discharge back to Housatonic River

- 1857 ▶ Mechanically placed backfill

- 1858 ▶ Off-site disposal of sediments containing 1.0 mg/kg PCBs or greater
- 1859 ▶ On-site beneficial re-use or off-site disposal of sediments with less than 1.0 mg/kg
1860 PCBs
- 1861 ▶ **Alternative 5: Pneumatic Flow Tube Mixing**
- 1862 ▶ Mechanical dredging followed by pneumatic conveyance and PFTM to solidify
1863 sediments and direct on-site placement of treated sediments
- 1864 ▶ Turbidity monitoring, management, and engineering controls (silt curtain) to control
1865 turbidity
- 1866 ▶ Land-based long-stick excavation of near shore sediments and truck transport to
1867 processing area
- 1868 ▶ Gravity dewatering (minimal) of excavated sediments
- 1869 ▶ S/S of dewatered sediments
- 1870 ▶ Water treatment and discharge back to Housatonic River
- 1871 ▶ Mechanically placed backfill
- 1872 ▶ Off-site disposal of sediments containing 1.0 mg/kg PCBs or greater
- 1873 ▶ On-site beneficial re-use of sediments containing less than 1.0 mg/kg PCBs
- 1874 ▶ **Alternative 6: Mechanical Dredging and Off-Site Processing**
- 1875 ▶ Mechanical dredging
- 1876 ▶ Turbidity monitoring, management, and engineering controls (silt curtain) to control
1877 turbidity
- 1878 ▶ Initial gravity dewatering
- 1879 ▶ Water treatment and discharge back to Housatonic River
- 1880 ▶ Barge transport of all sediments to off-site processing facility
- 1881 ▶ Processing (dewatering and S/S) at an off-site facility (e.g., Clean Earth)
- 1882 ▶ Mechanically placed backfill
- 1883 ▶ Off-site disposal of all sediments.
- 1884 ▶ **Alternative 7: Hydraulic Dredge/Cofferdam**

- 1885 ▶ Same components as Alternative 2 except for the following
- 1886 ▶ Turbidity monitoring, management, and engineering controls - cofferdam
1887 installation in lieu of silt curtain to accomplish:
- 1888 ▶ Turbidity control; and
- 1889 ▶ Hydraulic control of water level to allow for dredging over entire tidal cycle.
- 1890 ▶ **Alternative 8: Mechanical Dredge/Cofferdam**
- 1891 ▶ Same components as Alternative 3 except for the following
- 1892 ▶ Turbidity monitoring, management, and engineering controls - cofferdam
1893 installation in lieu of silt curtain to accomplish:
- 1894 ▶ Turbidity control; and
- 1895 ▶ Hydraulic control of water level to allow for dredging over entire tidal cycle.
- 1896 ▶ **Alternative 9: Amphibious Dredge**
- 1897 ▶ Either mechanical or hydraulic dredge operated on Tidal Flats or on water surface
1898 throughout tidal cycle
- 1899 ▶ Remaining components as described above for Alternatives 2 and 3 for
1900 mechanical or hydraulic methods
- 1901 ▶ **Alternative 10: Hydraulic Dredge/Shoreline CDF**
- 1902 ▶ Hydraulic dredging
- 1903 ▶ Turbidity monitoring, management, and engineering controls (silt curtain) to control
1904 turbidity
- 1905 ▶ Hydraulic slurry transport
- 1906 ▶ Installation of shoreline sheet pile with/ toe drains for CDF construction
- 1907 ▶ Building demolition to accommodate CDF
- 1908 ▶ Dewatering via Geotube behind CDF wall
- 1909 ▶ Water treatment and discharge back to Housatonic River
- 1910 ▶ Mechanically placed backfill
- 1911 ▶ Off-site disposal of sediments containing 1.0 mg/kg PCBs or greater

- 1912 ▶ On-site beneficial re-use of sediments containing less than 1.0 mg/kg PCBs as fill
- 1913 within shoreline CDF

- 1914 ▶ **Alternative 11: CAD Cell**

- 1915 ▶ Hydraulic dredging

- 1916 ▶ Turbidity monitoring, management, and engineering controls (silt curtain) to control
- 1917 turbidity

- 1918 ▶ Hydraulic slurry transport

- 1919 ▶ Installation/Excavation of CAD within either tidal flats or within Housatonic channel

- 1920 ▶ Sheet pile for tidal flats CAD

- 1921 ▶ Dewatering via Geotube on-site

- 1922 ▶ Water treatment and discharge back to Housatonic River

- 1923 ▶ Mechanically placed backfill including use of clean CAD sediments

- 1924 ▶ Off-site disposal of sediments containing 1.0 mg/kg PCBs or greater

- 1925 ▶ Placement of sediments containing less than 1.0 mg/kg PCBs within near-site CAD
- 1926 cell

1927 **4.3 Outfall-008 Drainage Ditch Alternatives**

1928 Three remedial alternatives (including No Action) are identified in this subsection to address
1929 RAOs for the sediment in the OF-008 drainage ditch. These alternatives are:

- 1930 ▶ **Alternative 1: No Action**

- 1931 ▶ **Alternative 2: Mechanical Excavation**

- 1932 ▶ Isolate and dewater area with sheet piles, earthen dams, and/or other temporary
- 1933 dam systems

- 1934 ▶ Mechanical excavation “in the dry” with conventional excavation (standard reach
- 1935 and/or long-reach) equipment

- 1936 ▶ Truck transport to sediment processing area

- 1937 ▶ Gravity dewatering

- 1938 ▶ S/S of dewatered sediments to meet on-site re-use requirements or off-site
- 1939 disposal acceptance criteria

- 1940 ▶ Water treatment and discharge back to Housatonic River
- 1941 ▶ Mechanically placed backfill
- 1942 ▶ Site/habitat restoration
- 1943 ▶ On-site re-use of non-TSCA sediments
- 1944 ▶ Off-site disposal of TSCA-regulated sediments
- 1945 ▶ **Alternative 3: Mechanical Dredging**
- 1946 ▶ Mechanical dredging with precision low turbidity mechanical dredge
- 1947 ▶ Mechanical off-loading of mechanically dredged sediment and truck transport of
- 1948 sediment to processing area
- 1949 ▶ Gravity dewatering
- 1950 ▶ S/S of dewatered sediments to meet on-site re-use requirements or off-site
- 1951 disposal acceptance criteria
- 1952 ▶ Water treatment and discharge back to Housatonic River
- 1953 ▶ Mechanically placed backfill
- 1954 ▶ Site/habitat restoration
- 1955 ▶ Off-site disposal of TSCA-regulated sediments
- 1956 ▶ On-site re-use or off-site disposal of non-TSCA sediments

1957 **4.4 Tidal Flats Alternatives Screening**

1958 **Table 4-1** summarizes the alternatives against effectiveness, implementability, and cost.

1959 For the Tidal Flats, Alternatives 1, 7, 8, 9, 10, and 11 as outlined in Section 4.2, have been
1960 eliminated from further evaluation.

1961 Alternative 1 (No Action) has been eliminated because the Army has determined that a remedial
1962 action must be taken to close the Site and continue with future development plans.

1963 Alternatives 2 through 6 have been retained because they all can achieve the RAOs, are
1964 implementable, and have comparable costs (moderately high).

1965 Alternatives 7 and 8 have been eliminated because of the complex implementation, extensive
1966 engineering, and high cost related to installation of a steel sheet pile cofferdam. Although this
1967 option would allow remediation to continue throughout the year because of the completeness of

1968 turbidity control, the additional time to design and install the structure is significant and the
1969 additional costs (\$20M) are not justified. Additionally, the design and installation of the cofferdam
1970 is technically complex near the existing breakwater, and sufficient buffer must be maintained so
1971 as not to encroach upon or damage that structure. This may necessitate removal occurring in that
1972 area prior to cofferdam installation, resulting in the need for turbidity control via silt curtain
1973 regardless for a portion of the work. Other significant technical challenges include ensuring
1974 complete enclosure around the area to ensure no bypass of tide waters into or out of the Tidal
1975 Flats.

1976 Alternative 9 has been eliminated due to the very soft nature of the site sediments and the
1977 elevated risk of generating excessive resuspended sediments using amphibious equipment.
1978 These risks outweigh the benefit of being able to work throughout tidal cycles.

1979 Alternative 10 (Shoreline CDF) has been eliminated from further consideration due to high cost,
1980 technical complexity, and additional time required to complete, with no additional benefits to site
1981 cleanup. Installation of this CDF would require extensive building demolition along the shoreline
1982 to allow for the placement of dewatered sediments. The wall itself must be installed to a depth of
1983 approximately 90 ft due to the low strength sediments present at the site. This option would add
1984 approximately one year on to the project schedule for design and construction.

1985 Alternative 11 (CAD cell) has been eliminated from further consideration. The selected locations
1986 are considered very difficult and time consuming to implement given the multiple jurisdictions that
1987 would be involved and its location within a navigation channel (Housatonic River). A CAD cell
1988 located in the Tidal Flats was also evaluated but determined infeasible based on the Site logistics,
1989 equipment needs, potential for conflict with future development plans, and the need for sheet pile
1990 walls. Other locations are possible; however, this disposal technology is not considered feasible
1991 within the timeframes anticipated for implementation of the project (immediate) and would not
1992 relieve the U.S. Army of long-term liability and related monitoring and maintenance activities.

1993 **4.5 Outfall 008 Alternatives Screening**

1994 **Table 4-1** summarizes the alternatives against effectiveness, implementability, and cost.

1995 For the OF-008 Alternatives, Alternatives 1 and 3 have been eliminated from further evaluations.

1996 Alternative 1 has been eliminated because no sediments would be removed, and it would not
1997 meet the RAOs or the U.S. Army's preference to eliminate long-term liability.

1998 Alternative 2 (isolate, dewater, and excavate), has been retained because the technologies are
1999 well established and can be effectively implemented. Water control is a critical element of this
2000 alternative; however, the technologies and expertise to implement this work are widely available.

2001 Alternative 3 (Mechanical Dredging) has been eliminated due to the difficulty of accessing the site
2002 by water, its narrow footprint, and an inability to effectively haul dredged material to the site for
2003 processing. Dredging and restoration with water present is more difficult than doing this work in
2004 a dewatered condition, and inherently less accurate or complete. Although costs are expected to

United States Army Corps of Engineers, New England District
Stratford Army Engine Plant, Stratford, CT
Final Focused Feasibility Study

2005 be lower relative to excavation in the dry, the lack of effectiveness outweighs the potential cost
2006 advantages.

2007 The following FFS sections describe the detailed evaluation and comparative analysis of the
2008 retained alternatives developed for remediation of sediment at the Site.

2009 **5.0 DETAILED EVALUATION OF ALTERNATIVES**

2010 This section presents the detailed analyses of the remedial action alternatives retained in Section
2011 4 for the Tidal Flats and OF-008 at the Site. The detailed analysis is intended to provide decision-
2012 makers with information to aid in selection of a remedial alternative that best meets the following
2013 CERCLA requirements:

- 2014 ▶ protects human health and the environment;
- 2015 ▶ attains ARARs (or provides grounds for invoking a waiver);
- 2016 ▶ utilizes permanent solutions and alternative treatment technologies or resource-
2017 recovery technologies to the maximum extent practicable;
- 2018 ▶ satisfies the preference for treatment that reduces toxicity, mobility, or volume of
2019 hazardous substances as a principal element; and
- 2020 ▶ is cost-effective.

2021 The detailed analysis is summarized in **Table 5-1** and was performed in accordance with
2022 CERCLA Section 121, the NCP (USEPA, 1990), and USEPA RI/FS guidance (USEPA, 1988).
2023 The detailed analysis contains the following:

- 2024 ▶ a detailed description of each candidate remedial alternative, emphasizing the
2025 application of various component technologies; and
- 2026 ▶ an assessment of each alternative with respect to the first seven of the nine evaluation
2027 criteria described in the NCP (USEPA, 1990). State and community acceptance are
2028 addressed following public review of the Proposed Plan.

2029 The detailed description of technologies or processes used for each alternative includes, where
2030 appropriate, preliminary site layouts and a discussion of limitations, assumptions, and
2031 uncertainties for each component. The descriptions provide a conceptual design of each
2032 alternative and are intended for alternative-comparison and cost-estimation purposes only.

2033 Remedial alternatives are evaluated according to the first seven of nine NCP evaluation criteria.
2034 The nine NCP evaluation criteria are defined in the following paragraphs as they pertain to this
2035 FFS.

2036 **Overall Protection of Human Health and the Environment.** Assesses how well an
2037 alternative achieves and maintains protection of human health and the environment.

2038 **Compliance with ARARs.** Assesses how the alternative complies with location-,
2039 chemical-, and action-specific ARARs, and whether a waiver is required or justified.

2040 **Long-term Effectiveness and Permanence.** Evaluates the effectiveness of the
2041 alternative in protecting human health and the environment after response objectives have

2042 been met. This criterion includes consideration of the magnitude of residual risks and the
2043 adequacy and reliability of controls.

2044 **Reduction of Toxicity, Mobility, or Volume through Treatment.** Evaluates the
2045 effectiveness of treatment processes used to reduce toxicity, mobility, and volume of
2046 hazardous substances. It also considers the degree to which treatment is irreversible, and
2047 the type and quantity of residuals remaining after treatment.

2048 **Short-term Effectiveness.** Examines the effectiveness of the alternative in protecting
2049 human health and the environment during the construction and implementation of a
2050 remedy until response objectives have been met. It also considers the protection of the
2051 community, workers, and the environment during implementation of remedial actions.

2052 **Implementability.** Assesses the technical and administrative feasibility of an alternative
2053 and availability of required goods and services. Technical feasibility considers the ability
2054 to construct and operate a technology and its reliability, the ease of undertaking additional
2055 remedial actions, and the ability to monitor the effectiveness of a remedy. Administrative
2056 feasibility considers the ability to obtain approvals from other parties or agencies and the
2057 extent of required coordination with other parties or agencies.

2058 **Cost.** Evaluates the capital, and operation and maintenance costs of each alternative.
2059 Present worth (PW) costs are calculated to help compare costs among alternatives.

2060 **State Acceptance.** Considers the state's preferences among or concerns about the
2061 alternatives, including comments on ARARs or the proposed use of waivers. This criterion
2062 is addressed in the Responsiveness Summary following state input on the Proposed Plan.

2063 **Community Acceptance.** Considers the community's preferences among or concerns
2064 about the alternatives. This criterion is addressed following community input on the
2065 Proposed Plan.

2066 The detailed analysis of each alternative includes an estimate of the time necessary for
2067 completion of the alternative (i.e., remedial duration) and a cost estimate (**Appendix F**). The time-
2068 frame estimates were based on development of productivity estimates for various methods of
2069 removal, the available schedule (hours per day, days per week, and months per year), and
2070 professional judgment. For purposes of the FFS, a seven-month work window (July 1st through
2071 January 31st) was assumed (see Section 2.1 for additional details).

2072 Costs are intended to be within the target accuracy range of minus 30 to plus 50 percent of actual
2073 cost (USEPA, 1988). Assumptions used to develop and estimate costs may or may not remain
2074 valid during alternative implementation. For example, as part of this FFS, it has been assumed
2075 that no building demolition will be included to accommodate on-site activities including placement
2076 of fill on-site. This assumption has potential to change as various stakeholders review the FFS
2077 and Proposed Plan. In addition, maintenance has not been included and is assumed to be the
2078 responsibility of the future property owner. Details related to monitoring and maintenance and
2079 related agreements will need to be evaluated and may affect costs. Cost uncertainties, where
2080 possible, are discussed in the text.

2081 Each cost estimate includes a present worth analysis to evaluate expenditures that occur over
2082 different time periods. The analysis discounts future costs to a present worth and allows the cost
2083 of remedial alternatives to be compared on an equal basis. Present worth can be a useful
2084 evaluation tool when comparing alternatives that rely differently upon aggressive source control
2085 actions vs. long-term monitoring (e.g., MNR). Consistent with USEPA guidance, a discount rate
2086 of 2.8% was used to prepare the cost estimates (USEPA, 2000) based upon the most recent
2087 Office of Management and Budget Circular A-94 (OMB 2016). In addition, costs occurring in future
2088 years were escalated to account for typical anticipated increases in construction costs. A value of
2089 3% per year has been used (RS Means 2017).

2090 Each cost estimate includes the following items, as applicable:

- 2091 ▶ engineering design at a percentage of direct capital costs (5%);
- 2092 ▶ project and construction management, including health and safety, legal, and
2093 administrative fees, at a percentage of direct capital costs (5% and 6%, respectively);
- 2094 ▶ a contingency to account for unforeseen project complexities such as adverse
2095 weather, the need for additional and unexpected site characterization, and increased
2096 construction standby times at a percentage of direct capital costs (20%); and
- 2097 ▶ Escalation to account for the anticipated yearly increases in construction costs (3%).

2098 Details and assumptions pertaining to the cost estimates are also included in each alternative's
2099 cost description.

2100 **5.1 Description of Remedial Alternatives**

2101 Detailed descriptions of the retained remedial action alternatives are described below. **Table 5-2**
2102 summarizes the key quantitative factors and assumptions for each of the remedial action
2103 alternatives used in the detailed evaluation. At this stage of evaluating the remedial alternatives,
2104 the Tidal Flats and OF-008 AOCs have been combined to create Site wide remedial action
2105 alternatives as further described below.

2106 **Tables 5-1** and **5-2** both include costs for on-site beneficial reuse and off-site disposal options as
2107 appropriate for each alternative. Cost differences between on- and off-site options for Alternatives
2108 that have both options are driven by two main factors: 1. For options including hydraulic dredging
2109 (Alternative 2), the overdredge volume is larger than for options that include mechanical dredging,
2110 which requires the processing and disposal of a larger quantity of sediment; and 2. For options
2111 utilizing geotubes or belt press dewatering (Alternative 2 and 4), no Portland cement is included
2112 while for options that utilize mechanical dredging the addition of 6% Portland cement adds to the
2113 cost (Alternatives 3, 5, and 6).

2114 **5.1.1 Alternative 2**

2115 **5.1.1.1 Tidal Flats**

2116 Alternative 2 includes the following remedial elements:

- 2117 ▶ Mobilization
- 2118 ▶ Site preparation
- 2119 ▶ Mechanical debris removal
- 2120 ▶ Hydraulic dredging and hydraulic pipeline transfer of the Tidal Flats sediments
- 2121 ▶ Mechanical placement of backfill
- 2122 ▶ Mechanical dewatering
 - 2123 ▶ Belt filter press
 - 2124 ▶ Geotubes
- 2125 ▶ On-Site beneficial re-use (stockpiling) of sediments containing <1.0 mg/kg PCBs
- 2126 ▶ Off-site disposal of sediments containing ≥ 1.0 m/kg PCBs or off-site disposal of all
- 2127 sediments
- 2128 ▶ Site restoration
- 2129 ▶ Demobilization

2130 **Figure 5-1** provides a conceptual layout of equipment, transport routes, and processing and
2131 disposal areas for Alternative 2. **Figure 5-2** provides a conceptual process flow diagram for the
2132 main components of Alternative 2.

2133 **Mobilization** – Alternative 2 will include a combination of land based and water-based
2134 mobilization. The location of the Site allows equipment and barges to be mobilized and
2135 assembled off-site then towed or pushed to the Site. It also allows for most water-based
2136 equipment to be mobilized to the Site by land and assembled on-site. Land based equipment or
2137 water-based equipment assembled on-site will be transported to the Site using federal, state, and
2138 local roads following all rules and regulations. Exact means and methods will be determined by
2139 the selected remedial alternative and contractor. Alternative 2 includes mobilization of a hydraulic
2140 dredge, hydraulic pipeline, mechanical dewatering equipment, and a land-based water treatment
2141 system.

2142 **Site Preparation** - Prior to initial mobilization of remedial equipment and construction of the
2143 staging area(s), erosion and sedimentation controls such as straw bales, silt fence, and silt socks

2144 will be installed on all downgradient slopes and catch basins as required in accordance with
2145 applicable Best Management Practices (BMPs). Once erosion and sedimentation controls are in
2146 place, the staging area(s) will be constructed. The staging area(s) will include an impervious area
2147 and a water collection sump in one or more locations to collect, transfer, and treat waste water
2148 generated through dredge material dewatering and rain water. The surface of the staging area(s)
2149 will be prepared by placing, grading toward the installed sump(s), and compacting an appropriate
2150 sized layer of dense grade aggregate. An impermeable high-density polyethylene liner will be
2151 placed over the aggregate followed by a layer of bituminous asphalt. Additional features
2152 including, but not limited to sidewalls, bituminous curbing, wheel wash stations, and
2153 decontamination areas may be installed as required by the selected remedial action contractor.

2154 For purposes of the FFS, we have identified two potential staging areas to be used depending on
2155 the Alternative selected; the smaller parking lot to the north of the site and the larger parking lot
2156 to the south of the site. The larger southern parking lot is approximately 10 acres in size while
2157 the smaller northern parking lot is approximately 3 acres. Eight acres of the southern parking lot
2158 is designated as the on-site stockpile location for all Alternatives (except Alternative 6) because
2159 it is adjacent to the OF-008 drainage ditch and is slightly more remote to commercial activities
2160 along Main Street. For Alternative 2, the mechanical dewatering equipment, water treatment, and
2161 temporary sediment stockpile are assumed to be staged in the small northern area. Access
2162 between the two staging areas will be via existing roads within the SAEP property and a temporary
2163 roadway crossing at the main site gate along Sniffens Lane.

2164 For purposes of cost estimating and describing the required elements of the work, it has been
2165 assumed that in-water resuspension controls such as turbidity curtains will be installed to
2166 surround the work area prior to the start of any silt producing activities and will be maintained
2167 throughout all silt producing activities including backfilling and restoration. During the design
2168 process, a performance specification would be developed to establish the turbidity monitoring
2169 requirements, including the following:

- 2170 • the type of, number of, and locations of real-time multi-depth monitoring equipment,
- 2171 • action levels (typically one or more progressive triggers based on an increase in turbidity
2172 at a downstream monitoring location relative to a background upstream location), including
2173 potentially different action levels for environmentally sensitive time periods, and
- 2174 • required remediation contractor responses for turbidity management and control which
2175 may include evaluating the current data, slowing or modifying methods, changing
2176 equipment, temporarily stopping work, or other actions.

2177 The details of the performance specification will be developed by the Army and reviewed and
2178 approved by appropriate agencies including CT DEEP. The design will also include a review and
2179 analysis of site specific conditions which must be factored into contractor selection of the turbidity
2180 control systems. The conditions and factors will include but may not be limited to the following:

- 2181 • weather conditions, including wind driven waves that directly affect the turbidity
2182 management system;
- 2183 • tidal fluctuations, including extreme astronomical or meteorologically driven tidal events;

- 2184
- flows in the Housatonic River, including storm flows and seasonally high flows; ant
- 2185
- the remedial contractor means and methods for transit of equipment and materials to and
- 2186
- from the site.

2187

2188 **Figure 5-1** presents a potential configuration of the proposed resuspension controls. The
2189 anticipated orientation of the silt curtain is generally parallel to the river flow and not within deeper
2190 sections of the river, and generally perpendicular to tidal flux in and out of the tidal flats. Given
2191 this configuration, tidal fluxes will likely govern aspects of the turbidity barrier design. The specific
2192 layout of the turbidity barrier will likely vary from what is currently shown depending on the
2193 approved final performance specification and approved contractor work plans.

2194 For purposes of the FFS, it has been assumed that resuspension controls will be maintained a
2195 minimum of one foot to a maximum of three feet from the sediment surface using attached reefing
2196 lines to prevent sweeping of bottom sediments and residual transport out of the work area. Type
2197 III permeable curtains (capable of withstanding water currents up to 3 knots or 5 feet per second)
2198 will be utilized in a bridal anchor configuration using Danforth or similar types of anchors. The
2199 permeable curtains coupled with a bridal anchor configuration will allow for water diffusion through
2200 the curtain on both ebb and flood tides while maintaining the curtain securely in position. The silt
2201 curtains may also be installed as a double curtain with windows to allow for the passage of more
2202 significant currents, if required. The final configuration and specification of turbidity curtain will be
2203 completed during the design process and will be required to meet the anticipated current flows of
2204 the Housatonic River and ebb and flood tides.

2205 Pre-construction surveys are proposed for all limits of work including the staging areas, site
2206 features (utilities, pavement cover, etc.), Tidal Flats, and OF-008. The pre-construction surveys
2207 will be a combination of topographic and bathymetric surveys to ensure the full site is
2208 characterized properly. It is assumed for this FFS that a limited pre-design investigation would
2209 be implemented to more accurately define where the dredge prism changes from one to two ft,
2210 two to three ft, and three to four ft removal depths.

2211 **Tidal Flats Dredging** - This alternative includes hydraulic dredging of 139,575 cy (neat) of Tidal
2212 Flats sediments range in thicknesses from 1 to 4 ft over approximately 47 acres. For purposes of
2213 this FFS, it has been assumed that an 8-inch swinging ladder cutter suction hydraulic dredge
2214 (**Appendix E, see Table 7**) would remove sediment by collecting sediment and water at the
2215 suction end (intake) of the dredge pump. The dredged material is first loosened and mixed with
2216 ambient water using the cutter head and pumped as a fluid (slurry). This slurry, which is
2217 anticipated to typically contain approximately 6% solids, but can vary from as low as 2% to as
2218 high as 20% depending on material type and dredge cut thickness, will then be pumped through
2219 a floating pipeline at a flow rate of approximately 1,250 gallons per minute (gpm) to the sediment
2220 processing area(s). Smaller 8-inch hydraulic dredges typically draft less than 2 ft; however, the
2221 selected remedial contractor will be required to closely monitor tides and schedule dredging
2222 operations to minimize downtime. This type of dredge has a vertical accuracy of 0.4 to 0.7 ft and
2223 typically can achieve an average over dredge of approximately 0.4 ft which has been used for
2224 purposes of cost estimating. In addition to over dredge, side slope volume has been included for

2225 cost estimating purposes as 1% of the neat line volume. The additional volume of over dredge
2226 and side slopes is estimated to be approximately 30,811 cy which will be removed as part of the
2227 dredging operation, processed, and either disposed of or re-used on-site.

2228 It is anticipated the contractor can maintain approximately 34% working efficiency with the
2229 appropriate coordination with tidal cycles and existing bathymetry over the course of a 12-hour
2230 day (5 to 6 hours available working time per shift in some areas due to tides). The production of
2231 hydraulic dredging is typically defined by the diameter of the dredge pump, the discharge velocity,
2232 the in-situ percent solids, the percent solids of the slurry, and the anticipated downtime associated
2233 with repositioning of the dredge. Two hydraulic systems as described above will have a combined
2234 average production of approximately 25 cy/hour (8-inch dredge, 1,250 gpm, 6% solids, and 34%
2235 efficient). This is equivalent to an average production of 304 cy per day for two hydraulic dredge
2236 systems assuming a 12-hour operating schedule, after accounting for efficiency. Based on these
2237 assumptions, and assuming a 5-day per week work schedule and seven months of allowable
2238 work window, three to four seasons of dredging work would be required to complete dredging.

2239 Dredging will generally need to proceed in a manner that allows the segregation of several
2240 categories of material and works from higher levels of contamination to lower levels of
2241 contamination: PCBs \geq 50 ppm (for off-site TSCA-permitted disposal), $1 \leq$ PCBs $<$ 50 ppm (for
2242 off-site RCRA D disposal), and PCBs $<$ 1 ppm for on-site beneficial reuse or off-site non-
2243 TSCA/RCRA D disposal or beneficial reuse. Segregation of materials is an additional factor that
2244 reduces efficiency further. Dredged materials meeting these criteria will require segregation on
2245 Site. Equipment will need to be decontaminated or flushed when moving from TSCA to non-TSCA
2246 areas.

2247 For purposes of cost estimating, it has been assumed that all sediments in the Tidal Flats would
2248 be removed via hydraulic dredging. However, it is feasible to excavate a portion of sediment from
2249 land in addition to hydraulic dredging. A long-stick excavator capable of reaching approximately
2250 75 ft could be used to allow for continued work at low tide for areas of the site which are most
2251 exposed at low tide and have the least number of workable hours for water-based equipment. It
2252 is estimated that 5,000 to 10,000 cy of material can be accessed from the dike and Causeway
2253 areas by a long-stick excavator. This material would need to be placed in off-road trucks and
2254 hauled to the staging area for gravity dewatering and solidification. This option has the potential
2255 to reduce the overall time required to complete the alternative by 1 to 2 months.

2256 Sediment removal areas have been assumed to be adequately delineated based upon previous
2257 sampling efforts and the remediation footprint presented in the Sediment Endpoints Report (Amec
2258 Foster Wheeler 2017). Limited additional sampling will be required prior to design to better define
2259 the limits where changes in the dredge prism depths occur. Removals will occur based on meeting
2260 bathymetric targets as determined by previous sampling activities.

2261 **Processing and Dewatering** – Two options for dewatering have been retained for the hydraulic
2262 dredging option based upon treatability tests for purposes of this FFS. Both Geotube dewatering
2263 and belt filter press dewatering have been evaluated as options based upon results of bench-
2264 scale treatability testing (**Appendix C, Kemron report Section 4.0, Table 2, Section 7, Table 5**);
2265 however, additional mechanical dewatering options that may be available to remedial contractors

2266 include a variety of proprietary dewatering systems such as Hi-G and Genesis. The belt filter
2267 press was selected to represent the mechanical dewatering technologies because in initial tests
2268 on polymer treated slurry, belt press outperformed both the recessed chamber press and the
2269 centrifuge, based on cake percent solids (53% for belt press, 42% for centrifuge, and 43% for
2270 recessed chamber at 100 psi). In subsequent tests performed for the recessed chamber press
2271 (baroid) on untreated slurry (no polymer) at pressures of 100 psi and 125 psi, the recessed
2272 chamber achieved cake percent solids of 66% at both the 100 and 125 psi pressures and 49% at
2273 125 psi. The actual polymers to be used for purposes of dewatering and water treatment will be
2274 determined by the selected remedial contractor and will be dependent on the actual technologies
2275 selected and contractor preference. Additional testing by the contractor will likely be required.

2276 **Belt Press Dewatering (Option 2A)** - It is anticipated that mechanical separation equipment and
2277 a series of 2.2-meter belt filter presses will be used for dewatering dredged materials at the Site.
2278 The incoming slurry will be dewatered in real time and will match the production of the dredge.

2279 Once the material is in the slurry and transferred to the staging area, it will undergo size separation
2280 using mechanical separation equipment followed by mechanical dewatering of the finer particulate
2281 sediment. For purposes of this FFS, belt filter press technology has been selected as a
2282 mechanical dewatering method to represent several process options that were evaluated in the
2283 treatability study (**Appendix C**, Section 7.1.1 and **Appendix C, Attachment C**, Kemron
2284 Treatability Report). For purposes of this FFS, it has been assumed that the slurry will be pumped
2285 to a series of screens and hydrocyclones that will separate the coarse fraction (sieve size 200+)
2286 to “de-sand” the material, leaving behind the finer materials (silt and clay fractions or sieve size
2287 200-) which can then be dewatered by the belt filter press. The coarse material will be stockpiled
2288 and allowed to gravity dewater. The fine material slurry at approximately 8% solids that passes
2289 the #200 sieve will be conditioned with a polymer and will proceed to a high-pressure, continuous
2290 feed belt press capable of obtaining pressures of approximately 200-500 psi (e.g., BP-1900 2.2
2291 M Andritz SMX-7 or similar) and pressed to provide a filter cake averaging 50-60% solids. The
2292 current recommendation from treatability testing is for addition of “Solve 137” (an organic cationic
2293 polymer) made down to a concentration of 0.5% added at a rate of 2.3 lbs/dry ton of solids to the
2294 slurry. Initial treatability study results indicated that a belt filter press resulted in filter cake that
2295 passes paint filter testing and achieved 53% solids (**Appendix C, Attachment C**, Kemron
2296 Treatability Report). Treatment of water generated from the dewatering process is discussed in
2297 greater detail below.

2298 The dewatered fines fraction filter cake should undergo additional testing to verify the
2299 concentrations of site contaminants are suitable for on-site beneficial re-use or other respective
2300 disposal categories due to the potential for contaminants (particularly PCBs) to adhere to the fine
2301 sediment particles. Given that in general, tidal flats sediment is at least 60 to 80% fine material
2302 in situ, the concerns over concentration of contaminants in the fines fraction is relatively limited
2303 but nonetheless should be monitored for any dewatering technology that relies upon size
2304 separation.

2305 **Odor Control.** During any dredging project, there is potential for odor generation from the
2306 various components of dredging and dredge material management processes. Generally, odor

2307 from sediments will be caused by anaerobic bacteria decomposing organic matter, ultimately
2308 producing hydrogen sulfide (H₂S) which has the following characteristics and sources:

- 2309 • H₂S is a colorless gas that is heavier than air, poisonous, corrosive, flammable, and
2310 explosive.
- 2311 • H₂S is relatively harmless at low concentrations, however, at higher concentrations the
2312 human nose is desensitized to H₂S odor, and consequently a person cannot detect its
2313 presence by smell alone. OSHA sets the permissible exposure limit (PEL) for H₂S.
- 2314 • H₂S can be detected and is a risk at the point of dredging, on dredges, in barges, dredge
2315 slurry, processing operations, offloading operations, and within any enclosed spaces
2316 such as treatment, storage, and handling facilities;
- 2317 • Hydraulic transport of slurry can generate significant concerns at the point of discharge
2318 due to agitation and accumulation of H₂S within the pipeline, and
- 2319 • Combined sewer outfalls, deeper dredge cuts, and clay can often be potential higher
2320 sources of H₂S risk which are generally not expected at SAEP.

2321 The following typical methods can help reduce or eliminate odors generated from dredging,
2322 material handling, dewatering, and water treatment:

- 2323 1. Dredging the sediment will expose the odor causing anaerobic bacteria to oxygen,
2324 reducing the potential to produce odor causing substances and air stripping the H₂S. In
2325 the absence of implementing other odor control techniques, odor will decrease naturally
2326 through this mechanism over time.
- 2327 2. Increasing pH of sediment, slurry or water will stop off-gassing of H₂S. The addition of
2328 Portland Cement or other alkalizing reagents (lime, calciment, caustic soda, etc.) will
2329 have an odor reducing effect by increasing the pH.
- 2330 3. Adding oxidizers such as permanganate, ferric chloride, ferric sulfate, peroxide, or
2331 chlorine bleach to sediment, slurry, or water treatment applications as appropriate will
2332 reduce the generation of H₂S and/or oxidize sulfide to sulfate. Other concerns related to
2333 these chemicals include how would they be added to sediment (or water), what are the
2334 costs, will there be other nuisance odors generated, and what are the health and safety
2335 concerns.
- 2336 4. Cover sediment stockpiles with Rusmar foam or similar. This will contain and mask the
2337 odors but will not neutralize them. Foam odor control agents are often used on MGP site
2338 remediation projects and control of odors from municipal solid waste transfer stations,
2339 which have extremely strong objectionable odors and can be easily adapted for use with
2340 sediment management.

2341 5. Other methods such as air release systems and venting systems coupled with air
2342 treatment for enclosed spaces or targeted air handling systems over operation can be
2343 necessary (e.g., “Sprung” structure).

2344 Based upon experience at other sites, the combination of oxidation during dredging and
2345 processing, processing with Portland cement or similar, and controlling odors with odor control
2346 foam or misters, would generally be sufficient in even the most sensitive projects. The Design and
2347 Contractor work plans will address the final methods to be selected for odor control that are
2348 specific to the final work methodologies.

2349 **Geotube Dewatering (Option 2B)** - The dredged slurry will be pumped directly into Geotubes
2350 for dewatering. Typically, polymers are added to the slurry to aid in coagulation and flocculation
2351 with the Geotubes to enhance filtration. As described in Section 3, Geotubes are large filter fabric
2352 bags which can accept a wide variety of dredged materials. Initial dewatering occurs as a result
2353 of solids flocculation, settling, and pressure from filling the bags. Following this initial dewatering,
2354 the bags are stockpiled on top of one another, allowing gravity to generate pressure and continue
2355 to squeeze water from the sediment over longer periods of time. Ideally, the Geotubes should sit
2356 for 30 to 45 days or longer, and, if possible, through a winter to allow additional dewatering from
2357 the freeze/thaw cycle. Following dewatering, the sediment would either be left on-site or
2358 excavated from the Geotubes and transported off-site. Treatability testing following the PGT
2359 (pressure-gravity drainage test) protocol showed that a starting slurry (conditioned with 2.3 lbs of
2360 Solve 137 polymer per ton of dry solids) containing 6% solids can be dewatered to 49% solids
2361 and pass the paint filter test, which is sufficient for off-site disposal (**Appendix C**, Attachment C,
2362 Kemron Treatability Report, Section 5.2 and Table 3).

2363 **Water Treatment and Discharge** - Fluids generated from dewatering processes will be collected
2364 and pumped to a water treatment system capable of treating influent to concentrations acceptable
2365 for discharge back into the Housatonic River adjacent to the Site. For purposes of this feasibility
2366 study, it has been assumed that water treatment will consist of equalization, initial chemical-aided
2367 settling, bag filtration, carbon adsorption, and final filtration. The estimated flow rate of the water
2368 treatment system has been calculated to be approximately 2,000 gpm. Based on the results of
2369 the treatability testing, dissolved metals may not be below state chronic marine standards (CT SB
2370 standards); however, because a dilution factor has not yet been determined (ERDC is developing
2371 a modeling to support appropriate dilution factors), it has been assumed that filtration to a finer
2372 size than 0.45 μ may be needed to remove adhered particulates sufficiently to meet these
2373 standards without accounting for possible allowable dilution (**Appendix C, Section 7.1.3** and
2374 **Tables C-13** and **C-14**). This assumption will need to be reassessed based upon substantive
2375 compliance with water quality certification requirements from CT DEEP. In the event of an indirect
2376 discharge to the Housatonic River through the Stratford WWTP (located just north of the site), an
2377 evaluation of the impacts to the WWTP would need to be completed in addition to the assessment
2378 of the impacts of discharge to the Housatonic River.

2379 In addition to comparison to numerical standards for site contaminants and other parameters,
2380 whole effluent toxicity (WET) testing will be required after selection of the final dewatering
2381 chemistry by the remedial contractor in accordance with narrative standards requiring waters and
2382 sediments to be free from toxicity [RCSA 22a-426-4(a)(5)].

2383 For PCBs, treatability results generally showed dissolved PCBs meeting standards (see
2384 **Appendix C, Tables C-3** through **C-5** for elutriates, and **C-12** for dewatering fluids); however, for
2385 the belt press, PCBs exceeded the state standard of 0.03 ug/L in the dissolved sample. Therefore,
2386 to ensure that dissolved PCBs or other organic contaminants do not exceed discharge standards,
2387 a polishing treatment step including activated carbon has been assumed. Additional water
2388 treatment tests have shown that filtration alone at the 0.1 μ size is effective at reducing PCBs to
2389 acceptable levels. However, for purposes of this FFS, it has been assumed that filtration coupled
2390 with activated carbon is necessary to achieve the required standards (not accounting for possible
2391 dilution) as PCBs may be preferentially sorbed to sediments and in the dissolved phase. In
2392 addition, of note is that in the belt filter press sample, PCBs in the filtered sample exceeded the
2393 TSCA treatment criterion of 0.5 μ g/L for discharge to a water body, suggesting that treatment may
2394 be required regardless of dilution to meet this standard (see **Appendix C Tables C-12, C-13, and**
2395 **C-14**).

2396 Treated water meeting discharge standards would be discharged via a discharge line running
2397 along the Causeway and discharging into deeper areas of the Housatonic River adjacent to the
2398 site. A flow diffuser would be included, if necessary, to meet water quality certification
2399 requirements and enhance dilution at the discharge area.

2400 **Disposal and Beneficial Re-Use** - The final step of dredged material processing is to dispose of
2401 or beneficially reuse the sediment on-site. All TSCA-regulated sediment will be dredged,
2402 processed, and stockpiled separately. Once dewatered, this sediment will be loaded onto haul
2403 trucks and sent off-site for disposal at a RCRA D and TSCA-permitted facilities based upon PCB
2404 concentrations. For purposes of this FFS, it has been assumed that the US Ecology Wayne
2405 Disposal facility in Michigan can accept the material.

2406 Non-TSCA sediment (containing less than 1.0 mg/kg PCBs and otherwise meeting CT RSR
2407 residential soil standards) will be managed in one of two ways pending further negotiations and
2408 approvals:

2409

- ▶ The first option is to beneficially reuse sediment on-site in the future. Under this
2410 scenario, the Army has assumed that an agreement with the developer will be in place
2411 which specifies that the developer will use the processed dredged materials as fill on
2412 site and that the Army will transfer ownership of the stockpile to the developer following
2413 completion of the tidal flats dredging project. Once dewatered, sediment would be
2414 placed in a stockpile suitable for long-term storage and future use as fill material.
2415 Sediment stockpiled on-site for future use will need to be protected against erosion
2416 and migration of contamination. An engineered soil cover will be needed over the
2417 stockpile, consisting of either a “spray-on” long-term foam which forms an
2418 impermeable cover (like a polyethylene liner) or top soil and seed (“loam and seed”).
2419 For purposes of this FFS it has been assumed that the stockpile would be covered
2420 with loam and seeded and would require annual inspections for five years to verify that
2421 erosion is not occurring. These requirements would be outlined in a stockpile
2422 maintenance plan that would be developed and implemented to ensure proper
2423 maintenance of the stockpile until the materials are re-used on-site by the developer.
2424 Final placement of the stockpile will be identified during design, developed in

2425 conjunction with future land owner preferences, and approved by CT DEEP prior to
2426 mobilization to address regulatory requirements regarding engineering controls and
2427 land use restrictions.

2428 ► For purposes of Alternative 2, it has been assumed that no additional processing
2429 beyond dewatering to meet the paint filter test would be necessary for sediments
2430 stored on site for future re-use. Results of leachability testing show the raw sediment
2431 and filter cake from both the belt press and Geotube to meet state groundwater B
2432 standards as measured via the SPLP test. This option would provide the most flexibility
2433 for future use of the sediments on the site (see **Appendix C** Section 4.0 and **Table C-**
2434 **8**).

2435 ► The second option for sediment disposition is off-site disposal. Once the sediment is
2436 dewatered and passes the paint filter test, the sediment will be loaded into haul trucks
2437 and disposed of off-site at the appropriate landfill based on characterization testing
2438 results and landfill acceptance requirements. Based on results of treatability testing,
2439 both filter pressing and Geotube dewatering yielded dewatered sediments that pass
2440 the paint filter test without the need for additional drying agents such as Portland
2441 cement or Calciment. In addition, it has been assumed that additional strength
2442 development of the dewatered sediments is not necessary to meet disposal facility
2443 requirements. Therefore, the addition of drying and/or strengthening agents has not
2444 been included for sediments being disposed of off-site. However, the addition of
2445 Calciment or other drying agents may provide a benefit by reducing the possibility of
2446 the release of liquids during transport and should be considered during design. Dump
2447 trailers used for transport are loaded to approximately 32 tons per truck (approximately
2448 6,000 to 7,000 loads of processed sediment). For purposes of this FFS, it has been
2449 assumed that processed sediment meeting RCRA Subtitle D disposal facility
2450 requirements would be transported to and disposed of at Waste Management's
2451 Turnkey Landfill in Rochester, NH (see **Appendix C** Section 5.0 and **Table C-9** for
2452 hazardous waste characteristic results).

2453 Additionally, if the dredged material described above cannot be used on-site as fill material after
2454 initial placement on-site and must be removed, it would be loaded into dump trailers trucks and
2455 transported as described above to appropriate disposal facilities. This process would be
2456 essentially identical to that describe above as the second sediment management option except
2457 for the need to re-excavate the material.

2458 Additional options may be available for off-site beneficial re-use of project sediments at the time
2459 of project implementation. These options should be considered and investigated during design
2460 and by remediation contractors when bidding the project. Within the state of CT, disposal as
2461 "polluted soil" under the state's polluted soil standards may be an option for the treated sediments.
2462 Under this regulation, soils containing low level detections of organic and inorganic substances
2463 may be used as fill at permitted sites within the state (if certain requirements are met, including
2464 approval by the Commissioner of CT DEEP). Disposal or re-use of dredged materials in this
2465 manner can be a cost-effective solution for disposal.

2466 **Backfill and Restoration** – Upon completion of sediment dredging and when the dredge area is
2467 approved for backfill placement, the northern staging area or another approved staging area on-
2468 site will be decontaminated and prepped for backfill delivery and stockpiling. Backfilling of the
2469 dredged area in this alternative will occur mechanically. Backfill material will be delivered and
2470 stockpiled near the Causeway. A Telebelt or similar will be positioned at the base of the
2471 Causeway. The Telebelt will load shallow draft sediment barges which will then be positioned
2472 next to the mechanical dredge. The dredge will reverse operations and place backfill material to
2473 the designed elevations. The material will be placed in thin lifts over the dredge area to design
2474 elevations. For purposes of the FFS, it has been assumed that a sand material will be used as
2475 backfill material, similar to, but generally slightly coarser than, the existing material which is
2476 predominantly silt. Silt and clay backfill material can be difficult to place due to material loss to the
2477 water column which causes excessive turbidity. In addition, finer material can be less stable and
2478 susceptible to erosion and/or movement and deposition, particularly in the Tidal Flats. Final
2479 backfill elevations have been assumed to be one foot below the pre-existing mudline with no
2480 backfill placed in the areas with 1-foot removal areas, which will allow for natural siltation to occur
2481 and bring elevations back to pre-existing conditions over time with silty material.

2482 For purposes of this FFS, it has been assumed that backfill restoration would be performed
2483 sequentially following dredging of all areas. However, it is likely that the site will be broken into
2484 certification units (CU), so that upon completion of one unit (for example, a five-acre area) based
2485 on meeting bathymetric and confirmation sampling requirements, backfill could begin in that area.
2486 The sequencing and location of the CUs would need to be determined in a logical fashion during
2487 design and/or contractor work plan development to account for factors such as dredging lanes,
2488 residuals management, cross contamination from migration of resuspended sediments, and other
2489 factors unique to the site. The turbidity management program would need to be developed to
2490 address these concerns which may include adjustment of monitoring station location and
2491 placement of additional engineering controls to minimize cross-contamination. With a separate
2492 crew and equipment, it is possible to reduce the project schedule considerably using this method.

2493 Establishing CUs is typically completed during design and document in a Basis of Design Report;
2494 therefore, this FFS does not include the development of CUs. Typically, CUs (management units)
2495 are formed either by regulatory requirement based on metrics specific to the type of dredging
2496 project. For a sediment remediation project like SAEP, CUs would likely be based on operational
2497 metrics (i.e., 1 acre or 5 acres), over which say dredging, confirmatory sampling, and
2498 capping/backfilling remediation components can efficiently be completed. The sequencing of CUs
2499 and procedures to address potential for cross-contamination would need to be addressed in the
2500 design and acceptance of contractor work plans. The use of CUs will be critical to compression
2501 of the schedule so that simultaneous dredging and backfill can occur according to the approved
2502 plan.

2503 The salt marsh areas within the Tidal Flats and OF-008 will be restored to pre-remediation
2504 conditions. When restoring a salt marsh, consideration of physical, hydrological, and biological
2505 conditions is critical. This is best done by thoroughly understanding the current conditions which
2506 allowed the salt marsh to become established. In addition, identifying a reference salt marsh is
2507 also critical to provide a point of comparison for the restored salt marsh.

2508 The initial step is to establish the edge of the marsh and restore the elevations, which are based
2509 on current and reference marsh elevations. Where existing marsh currently exists in small
2510 patches and along the shore within the Tidal Flats and OF-008, the seaward edge of these small
2511 marsh 'islands' and salt marsh bands would be where the edge of the restored marsh would begin
2512 and would continue landward to the rocky shore. This would likely increase the net area of
2513 restored salt marsh but would be the most ecologically sound and logical restoration approach.
2514 To establish the edge of the marsh, clam and oyster shell filled biodegradable bags (or similar
2515 materials) would be staked in place and then a sandy silt material would be backfilled up to the
2516 pre-established marsh elevation. Once the back fill has been placed and the elevation has been
2517 restored the hydrology should be consistent (i.e., tide cycle flooding and exposure) with existing
2518 conditions.

2519 Restoring the salt marsh vegetation with the same species of plants is also critical, as is where
2520 the marsh vegetation is replanted, as different salt marsh plant species occur on the salt marsh
2521 based on tolerance to several factors including tidal inundation and salinity. For instance,
2522 saltmarsh cord grass (*Spartina alterniflora*) typically grows along the edge of the salt marsh and
2523 tidal creeks and salt hay (*Spartina patens*) typically grows in the inner and upper salt marsh. The
2524 source of plant material to reestablish the salt marsh can be purchased from commercial sources;
2525 however, it should be augmented if possible with plugs taken from adjacent or nearby salt marsh.

2526 The salt marsh restoration as generally described above would require a detailed Restoration
2527 Plan that would include a Restoration Monitoring Plan with five years of post-restoration
2528 monitoring and a robust invasive species mitigation plan. The details of the Restoration Plan and
2529 Restoration Monitoring Plan will be developed during remedial design and will include the
2530 following elements at a minimum:
2531

- 2532 • Material Selection and Testing including physical and chemical acceptance criteria;
- 2533 • Placement methods including the requirement to place all materials within turbidity
2534 management areas;
- 2535 • Vegetation types and methods for re-establishment, and applicable areas; and
- 2536 • A five-year monitoring plan to document vegetation restoration success which would
2537 include recommendations for additional care as necessary.

2538 **Demobilization** - Upon approval of the final backfill, the staging area(s) and all impacted areas
2539 will be returned to preconstruction conditions. All equipment will be demobilized from the Site,
2540 including dewatering equipment, heavy construction equipment, dredges, and barges. All
2541 facilities constructed for the purposes of remedial operations will need to be removed from the
2542 site and disposed of, including staging areas, dewatering areas, asphalt material, trailers, and any
2543 other site facilities.

2544 **5.1.1.2 OF-008**

2545 Remediation of OF-008 includes mobilization of a long reach mechanical excavator, off-road
2546 transport trucks, sheet pile material and related installation equipment such as cranes, and

2547 construction of temporary roads. It is anticipated that the staging area used for dredging of the
2548 Tidal Flats will be used for staging, dewatering, and processing of sediments excavated from the
2549 OF-008 ditch prior to on-site placement and/or off-site disposal.

2550 **Site Preparation** - Prior to excavation, a temporary access road will be constructed along the
2551 west side of the drainage ditch which will allow for access by the long-reach excavator for most
2552 of the channel. At the head of the ditch, near the southern parking lot and staging area, the ditch
2553 is much wider and a second access road approximately 200 ft long along the east bank will be
2554 required to reach all parts of the ditch (see **Figure 5-1**). The temporary access road will be
2555 constructed directly over the existing surface and will consist of a geotextile liner followed by
2556 placement and compaction of 2 ft of dense-grade aggregate.

2557 The OF-008 work area is approximately 350 feet from the end of the Sikorsky Memorial Airport.
2558 Based on a limited analysis, sheetpile installation (crane use), sediment excavation, and transport
2559 activities for Outfall 008 will be within the approach zone to the airport, requiring the project will to
2560 file with the FAA for an airspace analysis. Special airport lighting, flagging, and equipment
2561 restrictions may be implemented based on the final design and construction coordination and
2562 construction start and notifications. Filing must be initiated at least 45 days prior to construction

2563 **Water Control** - To control stormwater entering the ditch from the outfall itself, a temporary
2564 pumping station will need to be constructed to divert water to the Marine Basin to the southeast.
2565 There are several methods for constructing this pumping station; however, for purposes of this
2566 FFS it has been assumed that sheet piling will be installed around the outfall to isolate the flow.
2567 Erosion control material consisting of riprap or large stone and a pump would be installed at the
2568 outlet. Water would then be pumped and discharged to the Marine Basin. A sampling plan would
2569 be implemented for the dewatering activities to ensure the water is free of entrained contaminants
2570 prior to discharge to the Marine Basin. A flow diffuser and sediment trap or other BMP would be
2571 installed to reduce any erosion at the pump discharge point. This pumping station would need to
2572 be operated during the length of the remediation.

2573 Water entering from flood tides will also need to be controlled. Based on observations made
2574 during two site visits conducted in February and October 2017, and based on conversations with
2575 site maintenance staff, tidal waters enter the OF-008 drainage ditch from both the adjacent airport
2576 drainage ditch and through the existing non-functioning gate at the ditch's outlet. Both of these
2577 sources of water will need to be controlled. As part of the remediation, the nonfunctioning tidal
2578 gate could be replaced or repaired so that it could be shut, sealing out tidal waters during
2579 remediation. Following remediation, it could then be returned to a normal open position depending
2580 on the desired level of interaction between the estuarine water and the ditch. Other methods to
2581 temporarily block tidal flow include installation of sheet piles landward of the tidal gate, or
2582 temporarily sealing the gate with inflatable pigs or grout. As-built drawings of the tidal gate are
2583 not available; therefore, the exact method will need to be determined during design or bidding. In
2584 addition, the method to control water during remediation will be dependent upon the final
2585 restoration to be designed for the ditch. Following remediation, the ditch could be fully opened to
2586 the estuarine waters, allowing full tidal interchange with the entire ditch.

2587 To control water entering the OF-008 drainage ditch from the airport ditch, an earthen berm or
2588 sheet pile wall would need to be installed. Elevations of the crest of the existing berm between
2589 the two ditches are in some locations only approximately 2 ft above mean water. High tides
2590 routinely exceed 3 ft above mean water and may be as high as 4 ft during extreme tides and even
2591 higher during storm events. Therefore, the berm or sheets, need to have a top elevation
2592 approximately 6 ft above mean water to ensure adequate freeboard to cover most storms. In
2593 addition, final restoration of this area will depend upon the intended hydrologic function of the
2594 area (complete saltwater connection or isolated freshwater drainage ditch with functioning tide
2595 gate).

2596 **Sediment Removal** - Once the access road, temporary facilities, and water control structures are
2597 constructed, sediment removal can begin. Sediment within the drainage ditch will be excavated
2598 in the dry in sections. The exact length of each section will depend on the selected contractor's
2599 approach to the work. For purposes of this FFS, it has been assumed the work will be completed
2600 in three cells: two cells of approximately 600 ft each for the main stem of the ditch which runs
2601 approximately 1200 ft in a NNW to SSE direction and one cell for the E-W portion of the ditch
2602 which is approximately 400 ft long. Temporary sheet pile will be installed across the ditch and
2603 water will be pumped and/or diverted out or around the section being excavated. Generally,
2604 standing surface water will be pumped around and discharged to the Marine Basin without
2605 treatment; however, for water remaining in the bottom of the ditch, and for water which enters the
2606 ditch from groundwater seepage, treatment may be required before discharge to reduce turbidity
2607 and/or chemical contamination. A dedicated water treatment system for the initial and continued
2608 dewatering of OF-008 will be located at the southern staging area.

2609 Once the sheets are installed and the water is diverted, all debris discovered within the OF-008
2610 ditch will be removed and hauled to the staging area for off-site disposal. The horizontal limits of
2611 targeted sediment removal are defined by the 0.0 MSL topographic contour, which will need to be
2612 verified at the time of remediation. The targeted sediment thickness for removal is four ft;
2613 therefore, all sediment with mudline elevations at 0.0 ft MSL or lower will be removed to a depth
2614 of four feet below the existing mudline. Sediment will be excavated with a vertical accuracy of
2615 approximately 0.25 ft (3 in) and a horizontal accuracy of approximately 0.33 ft (4 in) using a
2616 precision long reach excavator with a 2 cy open digging bucket.

2617 Additional removal above 0.0 MSL will be necessary to create stable side slopes (see **Figures**
2618 **2-12 through 2-15**). Beginning at the -4.0 ft MSL elevation (which is the vertical extent of
2619 excavation at the 0.0 ft MSL limit), sediment will be removed with an assumed side slope of 2V:1H
2620 upward from the -4.0 MSL point until the slope daylights at the surface on both sides of the ditch.
2621 This material will require segregation and characterization like the targeted sediments.

2622 The excavator will be outfitted with a Real Time Kinematic and Differential Global Positioning
2623 System (RTK-DGPS) that uses a series of inclinometers and sensors for precise location and
2624 monitoring of the bucket. This method of excavation will provide a high degree of accuracy and
2625 precision while removing sediments with percent solids concentrations near in situ values. It is
2626 anticipated the contractor can maintain 50% working efficiency with appropriate coordination. The
2627 production of the excavator is defined by the capacity of the bucket, the average grab of each
2628 bucket, the dig-swing-empty-reposition cycle time of the excavator, and the anticipated downtime

2629 associated with repositioning equipment. The mechanical system described above will have an
2630 average production of approximately 12 cy/hour (2 cy bucket, 60% full, 3-minute cycle time, and
2631 50% efficiency), which is equivalent to 144 cy per 12-hour shift. Therefore, the length of time to
2632 complete the excavation portion of the work is estimated at approximately 3 weeks per cell, or a
2633 total of 9 weeks of excavation work.

2634 Excavated sediment will be loaded into watertight Moxy MT-31 end dump trucks (or similar) with
2635 covered beds (or similar) positioned on the temporary road. The trucks will drive to the staging
2636 area(s) where the sediment will be processed. For TSCA-regulated sediments (i.e., concentration
2637 of 1.0 ppm PCBs or greater), material will be staged for gravity drainage to allow for the maximum
2638 amount of dewatering. Dewatering fluids will be captured and treated along with other waters
2639 from the site prior to discharge. Following dewatering of the TSCA-regulated sediment to the
2640 extent feasible, 6% Portland cement by weight will be mixed with sediment to eliminate any
2641 remaining free water and strengthen the sediment (this approach is intended to meet the
2642 substantive requirements of a TSCA risk-based approval from U.S. EPA following 40 CFR 761(c).
2643 For non-TSCA sediments, gravity drainage is not necessary, and sediments can be solidified
2644 immediately following placement at the staging area with 6% Portland cement. Based on
2645 treatability testing completed for Tidal Flats sediments, it was found that gravity drained sediments
2646 will not sufficiently dewater to pass the paint filter test in a reasonable amount of time; therefore,
2647 amendments have been assumed to be necessary to reduce free liquids for drainage ditch
2648 sediments (**Appendix C, Attachment C**, Kemron Treatability Report Section 6 Table 4 for gravity
2649 drainage results and Section 8.0, Table 6 for solidification test results and **Appendix C Table C-**
2650 **15** for leaching test results on solidified sediments). However, because the OF-008 drainage
2651 ditch sediments likely differ from the Tidal Flats sediments, it may be possible to fully or partially
2652 dewater the sediment via gravity drainage to reduce or eliminate additives necessary. Additional
2653 treatability testing may be required as part of bidding to determine if gravity drainage will be
2654 effective and what the exact percentage of stabilization agent to be mixed is. Once mixed,
2655 sediment will be stockpiled and allowed to cure prior to paint filter testing.

2656 Sediment removal areas are assumed to be horizontally and vertically delineated prior to
2657 dredging. However, additional delineation is recommended for Outfall 008 during pre-design or
2658 pre-construction to more accurately delineate the limits of TSCA- and non-TSCA-regulated
2659 material and establish the vertical limits due to the limited number of samples available. An
2660 elevation of 0.0 MSL has been assumed for purposes of the FFS for vertical removal limits.
2661 Sampling would be needed to verify the vertical limits of PRG exceedances. The proposed
2662 remedial alternatives do not include confirmation sampling or residual dredging in the cost or
2663 schedule for Outfall 008.

2664 All sediments containing 1.0 ppm or greater of PCBs will be excavated, processed, and stockpiled
2665 separately for either off-site RCRA D disposal (sediments greater than or equal to 1 ppm but less
2666 than 50 ppm) or TSCA-permitted facility disposal (sediments greater than or equal to 50 ppm).
2667 Once processed and dewatered at the staging area, this sediment will be loaded into on-road
2668 trucks and sent off-site for disposal at a RCRA D or TSCA approved landfill. For purposes of this
2669 FFS, it has been assumed that TSCA materials will be shipped to the US Ecology Wayne Disposal
2670 facility in Michigan.

2671 Non-TSCA sediment will be managed in one of two ways (on-site beneficial re-use or off-site
2672 disposal) pending further negotiations and approvals as described above for the Tidal Flats
2673 sediments.

2674 Water generated from the staging area will be collected and pumped to an on-site water treatment
2675 system consisting of settling, filtration, and carbon adsorption. Treated water meeting discharge
2676 requirements will be discharged back to the Marine Basin near the tidal gate at the end of the
2677 OF-008 drainage ditch.

2678 Once all sediment is excavated in the sheeted area and the area is approved, equipment and
2679 trucks will be decontaminated and prepped for backfill. The backfill material will be loaded into
2680 transport trucks where it will be driven down the temporary access road alongside the drainage
2681 ditch. The excavator will reverse operations and place backfill material to the appropriate
2682 elevations. For purposes of this FFS, it has been assumed that the backfill material will include
2683 3 ft of common fill overlain by a 1 ft layer of sandy organic material. Erosion control matting and
2684 seeding will be installed along the upper portions of the bank. Depending on requirements for
2685 restoration of the bank, and the type of environment (saltwater or freshwater), appropriate plant
2686 species and erosion protection will be installed as part of the restoration process.

2687 Once the area has been completely backfilled and approved, the area will be hydrated, and
2688 excavation will continue on the next section of the drainage ditch. This process will continue in
2689 sequence until all dredge and backfill has been completed.

2690 Upon approval of the final backfill, the staging area(s), temporary access road, and all impacted
2691 areas will be returned to preconstruction condition. All water control structures will be removed,
2692 and any remaining flooding of remediating areas will occur in a controlled fashion. It is assumed
2693 based on preliminary discussions with CT DEEP that the tidal gate between the Outfall 008
2694 drainage ditch and Marine Basin will be removed upon completion of the remediation to allow the
2695 full circulation of tidal waters to enter the Outfall 008 drainage ditch (Appendix D). Equipment will
2696 be demobilized from the Site.

2697 **5.1.2 Alternative 3**

2698 **5.1.2.1 Tidal Flats**

2699 Alternative 3 includes the following remedial elements:

- 2700 ▶ Mobilization
- 2701 ▶ Site preparation
- 2702 ▶ Mechanical debris removal
- 2703 ▶ Mechanical dredging and mechanical transfer of the Tidal Flats sediments
- 2704 ▶ Mechanical placement of backfill

- 2705 ▶ Gravity dewatering
- 2706 ▶ Solidification
- 2707 ▶ On-Site beneficial re-use (stockpiling) of sediments containing <1.0 mg/kg PCBs
- 2708 ▶ Off-site disposal of sediments containing ≥ 1.0 m/kg PCBs or off-site disposal of all
- 2709 sediments
- 2710 ▶ Site restoration
- 2711 ▶ Demobilization

2712 **Figure 5-3** provides a conceptual layout of equipment, transport routes, and processing and
2713 disposal areas for Alternative 3. **Figure 5-4** provides a conceptual process flow diagram for the
2714 main components of Alternative 3.

2715

2716 **Mobilization** – Mobilization for Alternative 3 will be as discussed above for Alternative 2; however,
2717 Alternative 3 also includes a mechanical dredge (rather than a hydraulic dredge), shallow draft
2718 barges, transport trucks, floating temporary water treatment system (rather than a land-based
2719 water treatment system and dewatering equipment as required for hydraulic dredging), crane
2720 barge, construction of temporary roads, and a pugmill. It is anticipated that the staging area
2721 located to the south of the site will be prepared and used for gravity dewatering and stabilization
2722 of the material prior to on-site placement and/or off-site disposal.

2723 **Site Preparation** - as discussed in Alternative 2. Prior to dredging and offloading, a temporary
2724 access road and drip apron will be constructed on the Causeway. The temporary access road
2725 will be constructed directly over the existing surface of the Causeway and will consist of a
2726 geotextile liner followed by compacted dense-grade aggregate. The drip apron will be designed
2727 to catch and contain any water and dredge material that may fall during transloading from barges
2728 to trucks.

2729 A static load analysis (Appendix E) was performed on the Causeway to determine the maximum
2730 allowable static load, given the current data and information available. It was determined that if
2731 a 2 ft thick and 20 ft wide construction access road was installed on top of the existing Causeway,
2732 the maximum allowable static surcharge load with an adjacent 4 ft deep dredge cut would be
2733 approximately 500 pounds per square foot, exceeding the typical loading expected from loaded
2734 off-road trucks. Additional modifications to the Causeway, such as the use of a geogrid and/or
2735 crane mats can further increase the load capacity. For this reason, the Causeway was considered
2736 a feasible loading/offload alternative.

2737 An additional analysis should be completed as part of design for sediment removal from the Tidal
2738 Flats to analyze dynamic loading and its impacts, including any protective measures that may be
2739 needed for the marine mattresses which armor the edges of the Causeway cover system.

2740 **Tidal Flats Dredging** - This alternative includes mechanical dredging using a precision low
2741 turbidity level cut environmental clamshell bucket which limits the amount of “overdredge”
2742 necessary to meet bathymetric targets while reducing the amount of excess water entrained in
2743 comparison to hydraulic dredging removal methods. Sediment will be dredged with a high degree
2744 of accuracy using a barge mounted precision excavator or a barge mounted crane coupled with
2745 a 3.5 cy level-cut sealed environmental clam shell bucket. The mechanical dredge(s) will be
2746 outfitted with a RTK-DGPS that uses a series inclinometers and rotation sensors for precise
2747 location and monitoring of the dredge bucket. This method of dredging will provide a high degree
2748 of accuracy and precision for removing sediments while maintaining solids content close to or
2749 slightly lower than the in-situ percent solid concentrations.

2750 Typical shallow draft barges will draft 2 to 3 ft. For this reason, the selected remedial contractor
2751 will be required to closely monitor tides and schedule dredging operations to minimize downtime.
2752 It is anticipated the contractor can maintain 31% working efficiency over a 12-hour work day with
2753 the appropriate coordination. The production of a mechanical dredge is generally defined by the
2754 capacity of the bucket, the average grab of each bucket, the dig-swing-empty-reposition cycle
2755 time of the crane or excavator, and the anticipated downtime associated with repositioning of the
2756 dredge barge. Two mechanical systems as described above will have an average production of
2757 approximately 39 cy/hour (3.5 cy bucket, 60% full, 2-minute cycle time, and 31% efficiency) or
2758 469 cy per 12-hour shift. This type of dredge has a vertical accuracy of 0.2 to 0.5 ft and typically
2759 can achieve an average over dredge of approximately 0.2 ft which has been used for purposes
2760 of cost estimating. The additional over dredge and side slope volume is estimated at an additional
2761 16,100 cy above and beyond the neat volume which will be removed during dredging operations,
2762 processed, and disposed of or re-used. Based on these assumptions, and assuming a 5-day per
2763 week work schedule and seven months of allowable work window, two to three seasons of
2764 dredging work would be required to complete dredging.

2765 Sediment removal areas are assumed to be horizontally and vertically delineated prior to dredging
2766 except for a relatively minor amount of pre-design sampling to better define the transitions from
2767 one depth to the next for purposes of designing the dredge prism and to further delineate several
2768 areas at the 4 to 5 ft and 5 to 6 ft depths below mudline that had not been previously characterized.

2769 **Confirmation Sampling.** The proposed remedial alternatives will include confirmation sampling
2770 and re-dredging as necessary to address residuals and achieve PRGs. For cost-estimating
2771 purposes in the FFS, a set of assumptions have been developed for analysis purposes; however,
2772 a detailed confirmation sampling program outlining the criteria for compliance will need to be
2773 developed during the design process. The design will define the type and frequency of samples
2774 to be collected, the required statistical evaluations of the data, appropriate comparisons against
2775 the PRGs, and decision criteria for the amount/extent of re-dredging in the case of failures.

2776 For purposes of the FFS, it was assumed that following dredging to the initial required limits,
2777 confirmation samples would be collected on a roughly 200 ft by 200 ft grid (0.92 acres) in the
2778 areas of sediment removal. Samples would be collected from each grid, advancing cores from 0
2779 to 12” below the newly dredged surface to adequately characterize the material. Analytes would
2780 include the eight site target metals for ERM-Q calculations, PCBs, and Hg.

2781 Typically, compliance with the PRGs would be measured by grouping the results from a number
2782 of grid cells within a compliance unit and performing a statistical analysis of the data followed by
2783 comparisons against PRGs. The next step in the process would be to determine what if any
2784 additional removals are required to achieve compliance. Depending on the methodology selected,
2785 it may be acceptable for a limited number of individual samples to exceed the PRGs while the
2786 average over a compliance unit would not exceed the PRG or the appropriate statistical
2787 comparisons. The actual number of samples to be collected and grouped together, and the
2788 frequency and type of samples (discrete or composite) will be determined during design. In
2789 addition, for areas containing PCBs exceeding 1.0 mg/kg, the design process will allow for the
2790 development of a separate confirmation sampling program for PCBs, which could include different
2791 sampling methods, frequencies, and statistical comparisons.

2792 It has been assumed that additional dredging of one foot would be conducted at 10% of these
2793 areas within the target dredge footprint. Following removal of an additional one foot of material,
2794 another round of confirmation sampling will be conducted to document remaining concentrations;
2795 however, no additional dredging would be performed beyond the additional one foot and in no
2796 case would dredging below a depth of 6 ft be conducted. Confirmation sampling followed by
2797 residual dredging would ensure the following:

- 2798 • sediments resuspended during dredging and then redeposited onto the completed
2799 dredge surface would be sampled and potentially removed if in quantities sufficient to
2800 cause exceedance of PRGs (this is of particular importance when dredging within TSCA-
2801 regulated areas to ensure that any potential migration of PCBs is detected and addressed
2802 if necessary);
- 2803 • sediments initially targeted for removal but not removed during the dredging process
2804 would be sampled and potentially removed if in quantities large enough to cause PRG
2805 exceedances; and
- 2806 • sediments below target elevations that remain above PRGs that were not identified during
2807 site characterization efforts would be sampled and potentially removed.

2808 **Processing, Dewatering, and Water Treatment** - Dredged buckets of sediment will be loaded
2809 into one of three shallow draft barges, with sump basins in the corners of the barges to facilitate
2810 dewatering. Barge capacities will range from 100 to 200 cy.

2811 Once a barge is loaded to capacity, the loaded barge will be transported via push boat to the
2812 barge offloading area positioned at the end of the Causeway where adequate draft is available
2813 during the entire tidal cycle. The barge will be docked against a floating temporary water
2814 treatment system to remove surficial freestanding water. Water collected will be treated by
2815 pumping through a water treatment system capable of treating influent to levels acceptable for
2816 discharge back into the waterbody at the Site. Based on the results of treatability testing,
2817 treatment has been assumed to consist of settling, filtration, and carbon adsorption (**Appendix**
2818 **C, Section 7.1.3**). The assumed flow rate of the system is 250 gpm. Once the barge is sufficiently
2819 decanted of freestanding water, it will be moved to a floating spudded crane barge. The crane
2820 will offload the sediment barge using a clamshell bucket and place the sediment into water tight
2821 Moxy MT-31 end dump trucks with covered beds (or similar) positioned on the Causeway. The
2822 trucks will drive to the staging area where the sediment will be loaded into a pugmill to mix a

2823 precise ratio of Portland cement (PC). A percentage of 6% by weight of PC has been assumed
2824 as a stabilization agent to be mixed with sediment (**Appendix C, Section 7.3**). Once mixed,
2825 sediment will be stockpiled and allowed to cure to pass the paint filter test. TSCA sediments will
2826 be handled as described above for OF-008 and may require additional gravity dewatering on land
2827 to allow for dewatering to the maximum extent feasible prior to any solidification to comply with
2828 the substantive requirements of a TSCA risk-based approval under 40 CFR Part 761(c) (see
2829 Table 2-1).

2830 **Disposal** - All TSCA sediment will be dredged, processed, and stockpiled separately. Once
2831 dewatered, this sediment will be loaded onto haul trucks and sent off-site for disposal at a TSCA-
2832 approved landfill. For purposes of this FFS, it has been assumed that the US Ecology Wayne
2833 Disposal facility in Michigan can accept the material.

2834 Non-TSCA sediment will be managed in one of two ways pending further negotiations and
2835 approvals (see above for Alternative 2 for a description of the two options, which are on-site
2836 beneficial reuse as fill material and off-site disposal at a RCRA D landfill).

2837 Water generated from the staging area will be collected and pumped to the floating water
2838 treatment system for treatment and discharge back to the Housatonic River near the Site.

2839 **Backfill and Site Restoration** - Once all sediment is dredged and the area is approved, the
2840 staging area(s) will be decontaminated and prepped for backfill delivery and stockpiling.
2841 Backfilling of the dredged area will occur mechanically. The backfill material will be loaded into
2842 articulated trucks where it will be driven down the Causeway and off-loaded. The crane will load
2843 decontaminated sediment barges which will then be positioned next to the mechanical dredge.
2844 The dredge will reverse operations and place backfill material to the design elevations using the
2845 same precise RTK GPS system used during sediment removal activities.

2846 Upon approval of the final backfill, the staging area(s), temporary access road, and all impacted
2847 areas will be returned to preconstruction condition. Equipment will be demobilized from the Site.

2848 **5.1.2.2 Outfall-008**

2849 The remedial alternative for OF-008 is as described in Alternative 2 for all Alternatives at the Site.

2850 **5.1.3 Alternative 4**

2851 **5.1.3.1 Tidal Flats**

2852 Alternative 4 includes the following remedial elements:

- 2853 ▶ Mobilization
- 2854 ▶ Site preparation
- 2855 ▶ Mechanical debris removal

- 2856 ▶ Mechanical dredging
- 2857 ▶ Hydraulic pipeline transfer of the Tidal Flats sediments
- 2858 ▶ Mechanical placement of backfill
- 2859 ▶ Mechanical dewatering
- 2860 ▶ Belt filter press
- 2861 ▶ Geotubes
- 2862 ▶ On-Site beneficial re-use (stockpiling) of sediments containing <1.0 mg/kg PCBs
- 2863 ▶ Off-site disposal of sediments containing ≥ 1.0 m/kg PCBs or off-site disposal of all
- 2864 sediments
- 2865 ▶ Site restoration
- 2866 ▶ Demobilization

2867 **Figure 5-5** provides a conceptual layout of equipment, transport routes, and processing and
2868 disposal areas for Alternative 4. **Figure 5-6** provides a conceptual process flow diagram for the
2869 main components of Alternative 4.

2870 **Mobilization** - as discussed in Alternative 2 and 3, and includes mobilization of a mechanical
2871 dredge, crane barge, mechanical dewatering equipment, and a land-based water treatment
2872 system. It is anticipated that the north staging area will be prepared and used for dewatering of
2873 the material prior to on-site placement at the south staging area and/or off-site disposal.

2874 **Site Preparation** - as discussed in Alternative 2.

2875 **Tidal Flat Dredging** – This alternative includes mechanical dredging technology as discussed in
2876 Alternative 3, with the ability to hydraulically transfer the dredged sediment. Alternative 4 requires
2877 a larger dredge barge to accommodate the onboard slurry box and pump. It is anticipated the
2878 contractor can maintain 26% working efficiency over a 12-hour work day with the appropriate
2879 coordination. Two mechanical systems as described above will have a combined average
2880 production of approximately 33 cy/hour (3.5 cubic yard bucket, 60% full, 2- minute cycle time, and
2881 26% efficiency) or 395 cy per 12-hour shift. This type of dredge has a vertical accuracy of 0.2 to
2882 0.5 ft and typically can achieve an average over dredge of approximately 0.2 ft which has been
2883 used for purposes of cost estimating. The additional over dredge and side slope volume is
2884 estimated at an additional 16,100 cy which will be removed during dredging operations,
2885 processed, and disposed of off-site or re-used on-site. Based on these assumptions, and
2886 assuming a 5-day per week work schedule and seven months of allowable work window, two to
2887 three seasons of dredging work would be required to complete dredging.

2888 **Processing and Dewatering** - Dredged buckets of sediment will be direct loaded into a slurry
2889 box with a screen located on the deck of the dredge barge. Material that passes the debris screen
2890 will enter the slurry box and will be slurried via a high efficiency, automated pump, with just enough
2891 makeup water to transport the material at the maximum rate practical and steady-state
2892 concentrations.

2893 Once the material is in the slurry it is handled the same way as Alternative 2.

2894 For purposes of the FFS, it has been assumed that dewatering fluids would be treated and
2895 discharged back to the Housatonic water, and that makeup water for the slurry system will be
2896 obtained from water adjacent to the operation. However, it is possible to recirculate fluids
2897 generated from the process for use as makeup water for the incoming slurry. Recirculation,
2898 therefore, has the potential to reduce the volume of water requiring treatment and the costs
2899 associated with water treatment. These factors would need to be analyzed in more detail in design
2900 and construction to determine if recirculation is feasible.

2901 **Disposal** - All TSCA sediment will be dredged, processed, and stockpiled separately. Once
2902 dewatered, this sediment will be loaded onto haul trucks and sent off-site for disposal at
2903 appropriate RCRA Subtitle D and TSCA-approved landfills based on PCB concentration. For
2904 purposes of this FFS, it has been assumed that the US Ecology Wayne Disposal facility in
2905 Michigan can accept the material.

2906 Non-TSCA sediment will be managed in one of two ways pending further negotiations and
2907 approvals (see above for Alternative 2 for a description of the two options, which are on-site
2908 beneficial reuse as fill material and off-site disposal at RCRA Subtitle D landfills).

2909 **Backfill and Restoration** - Once all sediment is dredged and the area is approved, the staging
2910 area(s) will be decontaminated and prepped for backfill delivery and stockpiling. Backfilling of the
2911 dredged area with Alternative 4 will occur mechanically. Backfill material will be delivered and
2912 stockpiled near the Causeway. A Telebelt or similar will be positioned at the base of the
2913 Causeway. The Telebelt will load shallow draft sediment barges which will then be positioned
2914 next to the mechanical dredge. The dredge will reverse operations and place backfill material to
2915 the designed elevations.

2916 Upon approval of the final backfill, the staging area(s) and all impacted areas will be returned to
2917 preconstruction condition. Equipment will be demobilized from the Site.

2918 **5.1.3.2 Outfall-008**

2919 The remedial alternative for OF-008 is as described in Alternative 2 for all Alternatives at the Site.

2920 **5.1.4 Alternative 5**

2921 **5.1.4.1 Tidal Flats**

2922 Alternative 5 includes the following remedial elements:

- 2923 ▶ Mobilization
- 2924 ▶ Site Preparation
- 2925 ▶ Mechanical Debris Removal
- 2926 ▶ Mechanical Dredging
- 2927 ▶ Gravity Dewatering
- 2928 ▶ Pneumatic Transfer and Mixing of Portland Cement of the Tidal Flats Sediments
- 2929 ▶ Mechanical Placement of Backfill
- 2930 ▶ Solidification (via PFTM)
- 2931 ▶ On-Site beneficial re-use (stockpiling) of sediments containing <1.0 mg/kg PCBs
- 2932 ▶ Off-site disposal of sediments containing ≥ 1.0 m/kg PCBs
- 2933 ▶ On-Site Stockpiling
- 2934 ▶ Site Restoration
- 2935 ▶ Demobilization

2936 **Figure 5-7** provides a conceptual layout of equipment, transport routes, and processing and
2937 disposal areas for Alternative 5. **Figure 5-8** provides a conceptual process flow diagram for the
2938 main components of Alternative 5.

2939 **Mobilization** - as discussed in Alternative 2, and also includes mobilization of a mechanical
2940 dredge, shallow draft barges, and a pneumatic flow tube mixer.

2941 **Site Preparation** - as discussed in Alternative 2.

2942 **Tidal Flat Dredging** – as discussed in Alternative 3.

2943 **Processing and Dewatering** - Once one of the barge is loaded to capacity, the loaded barge will
2944 be transported via push boat to the barge offloading area positioned at the end of the Causeway
2945 where adequate draft is available during all tidal ranges. The barge will be docked against a
2946 floating temporary water treatment system to remove surficial freestanding water. Water collected
2947 will be treated, if necessary, by pumping through a water treatment system capable of treating
2948 influent to levels acceptable for discharge back into the waterbody at the Site. In general,
2949 dewatering fluids can be incorporated into the Portland cement slurry that is created for mixing in
2950 the PFTM process. Once the barge is sufficiently decanted of freestanding water, it will be moved
2951 to a floating spudded crane barge. The crane will offload the sediment from the loaded scow and
2952 placed into a hopper for initial screening of large debris. Material that passes the debris screen

2953 will enter the pneumatic flow tube mixing system where it will be mixed with Portland cement and
2954 transported via pipeline. The sediment is conveyed via air pressure, which pushes the sediment
2955 in “plugs” with reduced friction in the pipeline. A Portland cement slurry is injected into the pipeline
2956 which is then thoroughly mixed in transit due to the turbulence created by the pneumatic pumping
2957 process. The end of the pipeline will be positioned to place the mixed sediment where it will be
2958 beneficially reused or stockpiled on site. In this regard, Alternative 5 has an advantage over other
2959 Alternatives when the final placement location is known because a second handling step would
2960 be avoided when the material is placed directly in its final location. The material cures quickly and
2961 is placed in lifts of desired thickness. Pneumatic flow tube mixers are capable of processing 2,000
2962 to 3,000 cy per day, well in excess of the anticipated dredging rates in the Tidal Flats. The exact
2963 production rate of the pneumatic flow tube mixer will vary with the sediment type and size of mixer.

2964 Treatability tests performed on Site sediments to simulate the PFTM process for solidification
2965 have shown that significant strength can be developed at modest Portland cement addition ratios
2966 which as little as 6% producing adequately strengthened sediments for on-site beneficial reuse
2967 (see **Appendix C** Section 8.0 and **Appendix C** Attachment D, Rutgers Center for Advanced
2968 Infrastructure and Transportation Solidification Report). Additionally, leaching tests on the
2969 solidified sediments show passing results for both SPLP (for on-site beneficial reuse, comparison
2970 against CT pollutant mobility criteria for GB zoned sites) and TCLP (for potential off-site disposal)
2971 (see **Appendix C Tables C-17** and **C-18**)

2972 **Disposal** - This alternative assumes that all non-TSCA material will be beneficially re-used on-
2973 site. TSCA-regulated sediment will be dredged as described above, except the material will be
2974 transferred from the smaller hopper barges to large 2,000 cy barges. The material will be
2975 transported via barge to an off-site TSCA-permitted processing and disposal facility such as Clean
2976 Earth or other approved facility.

2977 **Backfill and Restoration** - Once all sediment is dredged and the area is approved, the staging
2978 area(s) will be decontaminated and prepped for backfill delivery and stockpiling. Backfilling of the
2979 dredged area with Alternative 5 will occur mechanically. Backfill material will be delivered and
2980 stockpiled near the Causeway. A Telebelt or similar will be positioned at the base of the
2981 Causeway. The Telebelt will load decontaminated sediment barges with backfill material which
2982 will then be positioned next to the mechanical dredge. The dredge will reverse operations and
2983 place backfill material to the designed elevations.

2984 Upon approval of the final backfill, the staging area(s) and all impacted areas will be returned to
2985 preconstruction condition. Equipment will be demobilized from the Site.

2986 **5.1.4.2 Outfall-008**

2987 The remedial alternative for OF-008 is as described in Alternative 2 for all Alternatives at the Site.

2988 **5.1.5 Alternative 6**

2989 **5.1.5.1 Tidal Flats**

2990 Alternative 6 includes the following remedial elements:

- 2991 ▶ Mobilization
- 2992 ▶ Site preparation
- 2993 ▶ Mechanical debris removal
- 2994 ▶ Mechanical dredging
- 2995 ▶ Mechanical transfer of the Tidal Flats sediments and transfer to off-site sediment
- 2996 ▶ Processing Facility
- 2997 ▶ Mechanical placement of backfill
- 2998 ▶ Off-Site sediment processing including
- 2999 ▶ Gravity dewatering
- 3000 ▶ Solidification
- 3001 ▶ Off-Site disposal of sediments
- 3002 ▶ Site restoration
- 3003 ▶ Demobilization

3004 **Figure 5-9** provides a conceptual layout of equipment, transport routes, and processing and
3005 disposal areas for Alternative 6. **Figure 5-10** provides a conceptual process flow diagram for the
3006 main components of Alternative 6.

3007 **Mobilization** - as discussed in Alternative 2, and also includes a mechanical dredge, shallow
3008 draft barges, crane barge, and large capacity barges.

3009 **Site Preparation** - An upland staging area, as required for Alternatives 2, 3, and 4, will not be
3010 required for this option because there will be no processing or dewatering of sediment in the
3011 upland.

3012 **Tidal Flat Dredging** – as discussed in Alternative 3.

3013 **Processing and Dewatering** - Once one of the barges is loaded to capacity, the loaded barge
3014 will be transported via push boat to the barge offloading area positioned at the end of the
3015 Causeway where adequate draft is available during all tidal ranges. The barge will be docked
3016 against a floating temporary water treatment system to remove surficial freestanding water. Water
3017 collected will be treated by pumping through a water treatment system capable of treating influent
3018 to levels acceptable for discharge back into the waterbody at the Site. Once the barge is
3019 sufficiently decanted of freestanding water, it will be moved to a floating spudded crane barge.
3020 The crane will offload the sediment from the loaded scow and place into large (typically 2,000 cy)
3021 barges. The material will then be transported via barge to an off-site processing and disposal

3022 facility. For purposes of this FFS, it has been assumed that the Clean Earth facility in New Jersey
3023 can accept the sediment.

3024 Once all sediment is dredged and the area is approved, the staging area(s) will be
3025 decontaminated and prepped for backfill delivery and stockpiling. Backfilling of the dredged area
3026 under Alternative 6 will occur mechanically. Backfill material will be delivered and stockpiled near
3027 the Causeway. A Telebelt or similar will be positioned at the base of the Causeway. The Telebelt
3028 will load decontaminated sediment barges which will then be positioned next to the mechanical
3029 dredge. The dredge will reverse operations and place backfill material to the designed elevations.

3030 **Backfill and Restoration** - Upon approval of the final backfill, the staging area(s) and all impacted
3031 areas will be returned to preconstruction condition. Equipment will be demobilized from the Site.

3032 **Disposal** - This alternative assumes that all non-TSCA and TSCA material will be transported via
3033 barge to an off-site processing and disposal facility.

3034 **5.1.5.2 Outfall-008**

3035 The remedial alternative for OF-008 is as described in Alternative 2 for all Alternatives at the Site.

3036 **6.0 COMPARATIVE ANALYSIS OF ALTERNATIVES**

3037 The comparative analysis compares the candidate remedial alternatives with respect to the
3038 evaluation criteria used during the detailed analysis of alternatives. The purposes of the
3039 comparative analysis are to identify the advantages and disadvantages of alternatives relative to
3040 one another, to highlight differences among alternatives, and to aid in the development of a
3041 preferred remedial alternative that will be included in the Proposed Plan for the SAEP. The
3042 evaluation criteria are divided into three broad categories during remedy selection: Threshold
3043 Criteria, Primary Balancing Criteria, and Sustainability Criteria. Subsection 6.1 presents the
3044 approach of the comparative analysis based on the NCP with respect to these three categories;
3045 Subsection 6.2 presents the comparison of remedial alternatives.

3046 State and Community Acceptance are the Modifying Criteria and are not factored into the FFS;
3047 however, they will be addressed in the Responsiveness Summary which is appended to the
3048 Record of Decision following the public review process of the Proposed Plan. State and
3049 community acceptance are factored into a final balancing that determines the selected remedy.
3050 Formal state regulatory agency comments will not be received until after the agencies have
3051 reviewed the FFS report and Proposed Plan.

3052 **6.1 Evaluation Criteria**

3053 **Table 6-1** presents the comparative analysis of the alternatives with respect to the threshold and
3054 primary balancing criteria (identified in CERCLA guidance, USEPA 1988 and presented above in
3055 Section 5.0) and the Sustainability Criteria (consistent with state and federal guidance). These
3056 criteria are further discussed below.

3057 **6.1.1 Threshold Criteria**

3058

3059 USEPA designated (1) overall protection of human health and the environment, and
3060 (2) compliance with ARARs are the two threshold criteria. An alternative must meet both criteria
3061 to be eligible for selection as the preferred Site remedy or an ARAR waiver must be obtained.

3062 **6.1.2 Primary Balancing Criteria**

3063 The five primary balancing criteria are:

- 3064 ▶ long-term effectiveness and permanence;
- 3065 ▶ reduction of toxicity, mobility, or volume through treatment;
- 3066 ▶ short-term effectiveness;
- 3067 ▶ implementability; and
- 3068 ▶ cost.

3069 The balancing criteria provide a preliminary assessment of the extent to which permanent
3070 solutions and treatment can be used practicably and in a cost-effective manner.

3071 An alternative that is protective of human health and the environment, is ARAR-compliant, and
3072 affords the best balance among these criteria is identified as the preferred alternative in the
3073 Proposed Plan. Evaluation of the balancing criteria emphasizes long-term effectiveness and
3074 reduction of toxicity, mobility, or volume through treatment over short-term effectiveness,
3075 implementability and cost.

3076 **6.1.3 Sustainability Criteria**

3077 In accordance with the USEPA Consideration of Greener Cleanup Activities in the Superfund
3078 Cleanup Process (2016), the USEPA's Region 1 Clean and Green Policy for Contaminated Sites
3079 (2016), and CT DEEPs Guidance for Green Remediation in Connecticut, the applicability of green
3080 remediation practices is discussed for each of the remedial alternatives. The state largely
3081 references EPA criteria and guidance on its webpage:

3082 https://www.ct.gov/deep/cwp/view.asp?a=2715&q=570838&deepNav_GID=1626

3083 In addition, a presentation titled "Greener Cleanups: Integrating More Sustainable Approaches
3084 into Site Remediation in Connecticut," is included on the state's web page and describes EPA's
3085 core elements of greener cleanups related to: materials and wastes, energy, air, water, and land
3086 and ecosystems. CT DEEP also references BMPs and the ASTM Greener Cleanups Standard.

3087 **6.2 Comparative Analysis of the Remedial Alternatives**

3088 Comparative analyses of alternatives for the SAEP are presented in the following subsections
3089 and summarized in **Table 6-1**. The remedial alternatives that are the focus of the comparative
3090 analysis are:

3091 **▶ Alternative 2:**

3092 **▶ Tidal Flats:** Hydraulic dredge to hydraulic off-load and belt filter press or Geotube
3093 dewatering with mechanically placed backfill and on-site beneficial reuse or off-
3094 site disposal.

3095 **▶ OF-008:** Isolate and dewater area for mechanical excavation and truck transport
3096 to sediment processing area, gravity dewatering, solidification, on-site beneficial
3097 reuse or off-site disposal, mechanically placed backfill, and restoration.

3098 **▶ Alternative 3:**

3099 **▶ Tidal Flats:** Mechanical dredge to mechanical off-load, gravity dewatering,
3100 solidification, mechanically placed backfill and on-site beneficial re-use or off-site
3101 disposal.

- 3102 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport
- 3103 to sediment processing area, gravity dewatering, solidification, on-site beneficial
- 3104 reuse or off-site disposal, mechanically placed backfill, and restoration.

- 3105 ▶ Alternative 4:
- 3106 ▶ Tidal Flats: Mechanical dredge to hydraulic offload and belt filter press or Geotube
- 3107 dewatering with mechanically placed backfill and on-site beneficial reuse or off-
- 3108 site disposal.

- 3109 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport
- 3110 to sediment processing area, gravity dewatering, solidification, on-site beneficial
- 3111 reuse or off-site disposal, mechanically placed backfill, and restoration.

- 3112 ▶ Alternative 5: Mechanical Dredging/Pneumatic Flow Tube Mixing
- 3113 ▶ Tidal Flats: Mechanical dredge to PFTM with mechanically placed backfill and on-
- 3114 site beneficial re-use and off-site disposal of sediments exceeding 1 mg/kg PCBs.

- 3115 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport
- 3116 to sediment processing area, gravity dewatering, solidification, on-site beneficial
- 3117 reuse or off-site disposal, mechanically placed backfill, and restoration.

- 3118 ▶ Alternative 6: Mechanical Dredging/Off-Site Processing and Disposal
- 3119 ▶ Tidal Flats: Mechanical dredge to barge for off-site processing (Clean Earth or
- 3120 similar facility) with mechanically placed backfill and off-site disposal.

- 3121 ▶ OF-008: Isolate and dewater area for mechanical excavation and truck transport
- 3122 to sediment processing area, gravity dewatering, solidification, off-site disposal,
- 3123 mechanically placed backfill, and restoration.

3124 Each of the above alternatives includes off-site disposal of TSCA-regulated sediments containing
3125 PCBs at concentrations greater than or equal to 1 ppm, defined in two primary categories:

- 3126 ▶ RCRA Subtitle D disposal eligible - greater than or equal to 1 ppm but less than 50 ppm;
- 3127 and
- 3128 ▶ TSCA-permitted disposal facility - greater than or equal to 50 ppm.

3129 **6.2.1 Overall Protection of Human Health and the Environment**

3130 According to CERCLA, this criterion must be met for a remedial alternative to be chosen as a final
3131 site remedy.

3132 Alternatives 2 through 6 would all provide adequate protection of human health and the
3133 environment by removing contaminated sediments from the Tidal Flats, dewatering and treating
3134 those sediments as necessary to render them dry and non-leaching, and placing those sediments
3135 on-site for future beneficial re-use or disposing of those sediments off-site in a secure landfill.

3136 Each of these alternatives would protect the environment by removing sediments exceeding the
3137 ERMQ's and Hg and PCB cleanup criteria. Based on the proposed remedial footprint,
3138 concentrations of site-related contaminants remaining at depth by remediating sediment
3139 exceeding the PRGs will be at concentrations which do not exceed the ERM-Q PRG and will not
3140 be substantially different from background (Hg and PCBs). Short-term impacts to aquatic species
3141 would be mitigated through proper installation and maintenance of silt curtains.

3142 Although no human health risks were identified as drivers of remediation, all alternatives would
3143 also be protective of human health by removing sediments that exceed the ecologically-based
3144 PRGs, which are essentially more restrictive than human health criteria. By removing site
3145 contaminant concentrations to levels below ERM-Qs and to background concentrations, human
3146 health and ecological risks would be further reduced and the Tidal Flats and Outfall 008 drainage
3147 ditch will be returned to a condition for unrestricted use. By meeting these standards no long-
3148 term monitoring and maintenance will be required.

3149 **6.2.2 Compliance with ARARs**

3150 CERCLA requires that the selected alternatives also meet a second threshold criterion of
3151 compliance with ARARs or obtain a waiver if the criterion cannot be met. This criterion, according
3152 to CERCLA, must be met for a remedial alternative to be chosen as a final site remedy. Table 2-1
3153 presents the location-, chemical-, and action specific ARARs that have been identified for the Site.

3154 Alternatives 2 through 6 will all meet chemical-, location- and action-specific ARARs.

3155 All in-water work will comply with aquatic species work windows as required by CT DEEP, USFW,
3156 and NMFS. Currently, the allowable work window is from July 1st to January 31st; and all the
3157 alternatives would comply with this work window; however, USACE is actively working with the
3158 agencies and stakeholders to determine if it is feasible to extend this work window further.
3159 Appropriate mitigation measures will be implemented as required if the work window is extended
3160 beyond this period. All work will comply with substantive requirements of permits or certifications
3161 typically required for this work and in accordance with requirements negotiated with the agencies.

3162 All alternatives would meet WQC requirements for discharge of treated water back to the
3163 Housatonic River using appropriate water treatment technologies. Although all alternatives would
3164 meet these criteria, there are significant differences in the volumes of flow that would likely be
3165 treated and therefore, the likely allowable dilution which affects discharge standards.

3166 Any sediment placed on land at the site for beneficial reuse would comply with the CT DEEP
3167 regulations RCSA 22a-133k-2(h) "Use of Polluted Soil and Reuse of Treated Soil." Following
3168 completion of the Tidal Flats dredging, the Army would transfer ownership of stockpiles of
3169 processed dredged materials to the developer who would then be responsible for maintenance.
3170 Stockpiles of sediment would be covered or planted with grass to control erosion, with erosion
3171 control measures placed downgradient of the stockpiles to ensure there is no migration of

3172 sediments back to the Tidal Flats and OF-008. Sediment placed on-site would meet the CT GWB
3173 standards as measured by the SPLP test (treatability tests have shown that raw sediment meets
3174 these standards – see Section 4.0 of **Appendix C** and **Table C-8**) and sediments treated with
3175 Portland cement and Calciment by Mintek also meet these standards (see Sections 7.3 and 8.0
3176 of **Appendix C** and **Tables C-15, C-16, C-17, and C-18**) and would not be placed below the
3177 water table. In addition, a stockpile maintenance plan would be developed and implemented to
3178 ensure proper maintenance of the stockpile until the materials are reused on-site.

3179 All alternatives will comply with the substantive requirements of TSCA, including segregation of
3180 materials, decontamination of equipment, and off-site disposal at appropriately permitted facilities
3181 including RCRA Subtitle D facilities (for sediments with PCB concentrations between one and 50
3182 ppm) and TSCA-permitted facilities (for sediments containing PCBs at concentrations greater
3183 than or equal to 50 ppm). In addition, sediments will be dewatered to the maximum extent feasible
3184 prior to any solidification, and all alternatives would comply with the substantive requirements of
3185 obtaining a risk-based approval for solidification under 40 CFR Part 761(c).

3186 Sediment disposed of off-site would be processed to meet the receiving facilities' acceptance
3187 criteria.

3188 Restoration of the Tidal Flats and OF-008 will be completed using a backfill material that is
3189 consistent with existing soils. The flood storage capacity of each of these bodies of water would
3190 be maintained or increased, which no encroachment below the high tide line.

3191 **6.2.3 Long-term Effectiveness and Permanence**

3192 Each of the alternatives would permanently remove sediments from Tidal Flats and OF-008, and
3193 place backfill materials to reestablish habitat. There is essentially no difference between
3194 alternatives with respect to this criterion. Following remediation, ecological risks would be
3195 addressed in the tidal flats and the Outfall 008 drainage ditch, with no sediments remaining within
3196 these areas exceeding site PRGs. Any site contaminants remaining would be at concentrations
3197 that do not cause exceedance of the ERM-Q of 0.5, and below 0.40 mg/kg Hg and 0.20 mg/kg
3198 PCBs (PCBs are co-located with metals and are therefore not driving the remediation footprint).

3199 However, when comparing options for on-site re-use and off-site disposal, off-site disposal has
3200 more permanence because the material would be placed in a secure off-site landfill facility rather
3201 than placed on-site. The State of CT requires certain conditions to be met prior to placement of
3202 contaminated materials on land – these conditions (as defined for “polluted soils” under the CT
3203 RSRs, Section 22a-133k-1(a) and (h)) would be met including placement above the water table;
3204 however, under CT RSRs it is uncertain if the material would be considered “inaccessible soil” or
3205 “environmentally isolated” because the exact location for placement has not yet been determined
3206 and ultimately must be consistent with the future developer’s plans. Therefore, the adequacy and
3207 reliability of the engineering controls to be used to ensure future isolation of the contaminated
3208 materials is uncertain until a full development plan is available.

3209 Furthermore, on-site options that do not include solidification, Alternatives 2 and 4, which rely on
3210 mechanical dewatering methods or Geotubes, do not require the addition of additives for
3211 placement on site. In this respect, the remediation may not be permanent because future
3212 solidification may be required to meet future reuse criteria with respect to strength, which are
3213 currently unknown.

3214 **6.2.4 Reduction of Toxicity, Mobility, or Volume through Treatment.**

3215 This criterion evaluates whether the alternatives meet the statutory preference for treatment under
3216 CERCLA. The criterion evaluates the reduction of toxicity, mobility, or volume of contaminants,
3217 and the type and quantity of treatment residuals.

3218 None of the alternatives have as a principle element treatment or destruction of site contaminants.
3219 Alternatives 2 through 6 all reduce contaminant toxicity, mobility, and volume through sediment
3220 removal, processing, and placement on land. Alternative 2 and Alternative 4 both include the
3221 hydraulic transport of a sediment slurry and therefore have a higher volume of water treatment
3222 required in comparison to Alternative 3, mechanical transport, Alternative 5, PFTM transport and
3223 Alternative 6, off-site transport.

3224 All dewatering fluids will be treated to remove metals and PCBs down to acceptable
3225 concentrations for discharge, with the contaminants concentrated in filtered solids and activated
3226 carbon, which require separate off-site disposal or regeneration.

3227 All alternatives that include mechanical dredging with barge movements, have a slightly higher
3228 potential when compared to hydraulic transport options to temporarily resuspend sediments due
3229 to the movements of tug boats and barges. These resuspended sediments can be controlled
3230 using silt curtains and a properly implemented turbidity monitoring, management, and control
3231 program.

3232 Alternatives that include solidification (Alternatives 3, 5, and 6) have the potential to increase the
3233 volume of material due to bulking which can occur. Typically, this bulking is a modest increase (5
3234 to 10%) given the anticipated percentages of additives.

3235 **6.2.5 Short-term Effectiveness**

3236 CERCLA requires that potential adverse short-term effects to workers, the surrounding
3237 community and the environment be considered during implementation of a remedial action.

3238 All the alternatives include removal as a component, therefore the RAOs will be met upon
3239 completion of the work. The time to achieve RAOs includes the time for mobilization, dredging,
3240 backfill, and site restoration. These factors vary between the alternatives and the most significant
3241 factor for the time to achieve RAOs is whether sediments are dredged mechanically or
3242 hydraulically. Generally, mechanical dredging options have a shorter timeframe because of the
3243 higher anticipated productivities.

3244 The baseline schedule assumptions for the project schedule include a seven-month allowable
3245 work window and five twelve-hour days per week.

3246 For options that include mechanical dredging, the time is shortest and is essentially the same or
3247 similar for all alternatives. For alternatives 3, 4, 5, and 6, the time required to complete the project
3248 is estimated at 3 to 4 seasons (assuming a seven-month work window and five twelve-hour days
3249 per week). In terms of months of dredging (not including backfilling), these alternatives are
3250 estimated to require approximately 15 months (slightly over two full seasons) to complete.
3251 However, with respect to schedule, Alternative 6 would have the shortest overall schedule for
3252 work on the site because it would require the least amount of on-site infrastructure, because it
3253 does not require sediments to be placed on the site. Following Alternative 6, Alternative 5 (PFTM)
3254 would have the next longest schedule, followed by Alternative 3, Mechanical Dredging.

3255 Alternative 4, Mechanical Dredging with Hydraulic Transport, while similar to other mechanical
3256 dredging options, would have the next longest schedule, which is also estimated to require three
3257 to four dredge seasons, and approximately 18 months of dredging.

3258 Alternative 2, Hydraulic Dredging would have the longest schedule, with an estimated total project
3259 time of five to six seasons. Dredging work requires approximately 26 months to complete. This
3260 extended period of time is driven by the lower anticipated productivity of a hydraulic dredge in this
3261 environment.

3262 Given the baseline schedule of 7 months of working time per year, multiple mobilizations and
3263 demobilization (mob/demob) will need to occur. Except for at the very beginning of the project
3264 and final demobilization, these mob/demobs do not add to the overall project schedule because
3265 they can be conducted during the off-season. For each alternative it is assumed that mobilization
3266 and demobilization each add approximately three months to the beginning and end of the project.

3267 **Table 6-2** provides a work schedule sensitivity analysis which analyzes the effect on overall
3268 schedule when the baseline assumptions are varied. Three key assumptions were changed: 12-
3269 hours working day to a 24-hour working day; five days per week was varied to six and seven days;
3270 and the annual work window was expanded from seven months to twelve months. The simple
3271 change in the baseline assumptions of going to 24 hours per day results in the schedule
3272 decreasing to 2 to 3 seasons from the baseline condition of 3 to 5 seasons.

3273 By changing the daily work schedule to 24 hours per day, the overall project schedule decreases
3274 from three to five seasons down to 2 to 3 seasons for five days per week to as little as one to two
3275 seasons for 7 days per week operation.

3276 Finally, if 12 months per year operation is implemented, the project schedule improves to 2 to 3
3277 seasons for five-day and one to two seasons for seven-day operation. If the schedule is improved
3278 to 24-hour operation, the timeframes decrease to one to two seasons (five days per week) to as
3279 little as approximately one season, or even slightly less. All these scenarios assume two dredges

3280 operating simultaneously. For any option that considers twelve months per year operation, six
3281 months of mob/demob time must be added to the schedule (i.e., a twelve-month dredging during
3282 becomes an 18-month project duration).

3283 To support the option to operate twelve months per year, the option to install a cofferdam was
3284 further evaluated. Design and construction of a large cofferdam is a time-consuming, technically
3285 challenging, and expensive task. In this case, the cofferdam would likely be a semi-permanent
3286 structure approximately ½ mile long, beginning just inboard or outboard of the rock breakwater
3287 and extending parallel to the river, then continuing southeast beyond the tip of the Causeway,
3288 then turning towards shore to enclose the entire remedial footprint of the Tidal Flats. Additional
3289 geotechnical data would need to be collected along its proposed alignment to ensure
3290 constructability. The structure itself would likely need to be a double sheet pile infilled wall
3291 embedded approximately 90 ft into sediment (based on current information regarding subsurface
3292 conditions) to be able to withstand tidal elevation differences, wave action, and other concerns,
3293 such as ice and flooding. Near the existing breakwater, construction would need to be done with
3294 adequate offsets to ensure no damage to the structure. Other considerations such as concerns
3295 regarding potential flooding and how to maintain water levels must be evaluated thoroughly. The
3296 movement into and out of site by dredging equipment, maintenance and other vessels, would all
3297 be significantly impacted by the presence of a cofferdam.

3298 Construction of a coffer dam may produce a great deal of suspended sediment during its
3299 installation, likely more than those suspended sediments anticipated from dredging. Consultations
3300 with NMFS, USFWS and CT DEEP would be required and their opinion of the use of a coffer dam
3301 and its environmental impacts is unknown. There would still be impacts to potential winter
3302 flounder habitat within the Tidal Flats. There would still be a degree of sedimentation during
3303 construction that would have an impact on shellfish spawning and general mortality due to burial,
3304 as well as impacts to migrating anadromous fish depending on the time of year.

3305 The design and construction of a cofferdam would likely add a year to the project schedule and
3306 would have to be removed at the end of the project adding yet more time to the project schedule.
3307 The additional cost of installing a cofferdam is likely \$20M.

3308 Traditional methods of turbidity control using silt curtains or similar technology can achieve a
3309 similar, if not better, level of overall performance with respect to turbidity control (especially when
3310 considering the construction of the cofferdam itself).

3311 Given the ability to mitigate the effects of sediment resuspension for dredging, the time required
3312 to design and construct the cofferdam, and the cost, use of a cofferdam is not considered a cost-
3313 effective option for the site.

3314 An additional consideration is release of suspended sediments, which has the potential to impact
3315 downstream ecological receptors. All mechanical and hydraulic dredging alternatives will cause
3316 release and resuspension to some degree as affected by the necessary operational processes;
3317 for example, at the cutter head or bucket, tug and support vessel propwash, anchor management,
3318 pipeline back flushing, and impacts with the bed. In most cases these release mechanisms can

3319 be managed by selecting appropriately sized and configured equipment, conducting operations
3320 in a manner that avoids or minimizes release, and mitigated by installing proper engineering
3321 controls. Properly installed and maintained turbidity curtain systems as part of a properly
3322 implemented turbidity monitoring, management, and maintenance program is one such
3323 engineering control that can substantially contain resuspension and manage any turbidity
3324 migration.

3325 There are other differences between the alternatives that can be highlighted. Alternatives that
3326 require stockpiling and dewatering of the sediment on-site will generate nuisance odors, visual
3327 disturbance, and excess noise due to the processing equipment. Only Alternative 6 (off-site
3328 processing), which relies on off-site processing with hauling by barge would have no or little on-
3329 site stockpiling of sediment and would therefore impact the local community less. Alternative 5,
3330 through the PFTM process, would also impact the local community less than Alternatives 2
3331 through 4 because sediment is treated with Portland cement before it is placed on land. When
3332 the sediment is placed, it requires little or no handling, reducing noise, visual disturbance and
3333 odors (because it has been pre-treated).

3334 Finally, any alternative that involves hydraulic dredging or hydraulic transport (Alternatives 2 and
3335 4) will generate many times more water than mechanical dredging (Alternatives 3, 5, and 6) which
3336 increase the footprint of the site and the general amount of activity on the site.

3337 Alternatives 2 through 5 involving complete off-site disposal of sediments via truck as an option
3338 will generate on the order of 6,000 truck trips to transport sediments off-site.

3339 Impacts to workers are considered essentially equal among the alternatives, and include work
3340 with heavy equipment, other mechanical equipment, work on water, and potential chemical
3341 exposure to PCBs and metals. These risks can be mitigated by following OSHA requirements and
3342 an approved safety plan.

3343 **6.2.6 Implementability**

3344 This criterion evaluates each alternative's ease of construction and operation, and availability of
3345 services, equipment, and materials to construct and operate the alternative. Also evaluated is the
3346 ease of undertaking additional remedial actions and administrative feasibility.

3347 Alternatives 2, 3, and 4 all rely upon technologies that are well-established, readily available, and
3348 easily mobilized at the site. Alternative 5 relies upon the PFTM technology, which, while well-
3349 established and available in Asia, has not been widely available in the United States. Only one
3350 vendor of this technology is known to exist in the United States and it is actively pursuing permits
3351 to operate within CT. The equipment would likely have to be customized for this project.

3352 Alternative 6 relies upon the ability to transport sediments to an off-site processing facility.
3353 Currently there are several facilities within the greater New York City area that could receive
3354 sediments. These facilities, while relatively new, are up and running and have indicated they can

3355 accept Site sediments for processing and off-site disposal. Barge transport can be cost-effective
3356 and can open up rail transport options which can then allow for cost-effective disposal at
3357 potentially more off-site facilities.

3358 The dewatering and water treatment technologies are all well established and available and can
3359 relatively easily be mobilized and operated at the site. However, systems that are more complex
3360 (i.e., mechanical dewatering methods or Geotubes, Alternatives 2 and 4), will require more
3361 maintenance and have more risk of unreliable operations than a simple gravity dewatering
3362 operation. Geotubes require additional space for layout, may require additional time for
3363 dewatering, can experience biological fouling or clogging and mechanical equipment is subject to
3364 breakdown.

3365 Similarly, these options (Alternatives 2 and 4) require larger and more complicated water
3366 treatment systems that have more risk of failures than the smaller systems required to handle
3367 water from gravity drainage (Alternatives 3 and 5). It is possible to reduce the volume of water
3368 generated under Alternative 4 further by recirculating dewatering fluids back into the slurry box.
3369 Alternatives 2 and 4 require mechanical dewatering systems (traditional belt press, recessed
3370 chamber, or centrifuge), Geotube bag filtration, or other systems (proprietary systems that use a
3371 combination of technologies, examples include Hi-G by Derrick and Genesis). These proprietary
3372 systems were not evaluated as part of the FFS; however, they may be viable depending on the
3373 selected contractor's familiarity with and access to this specialty equipment. The Derrick Hi-G
3374 system (a hydrocyclone and screening system that utilizes a unique elliptical screen motion to
3375 accelerate dewatering of fines) had been selected as a representative technology for evaluation
3376 in treatability studies; however, this work could not be completed based on Derrick's inability to
3377 test PCB-contaminated sediments. Although the primary dewatering methods evaluated in this
3378 FFS are the belt filter press and Geotube dewatering systems, proprietary systems should not be
3379 eliminated from potential consideration in remedial contractor bids due to their potential to
3380 effectively dewater sediments.

3381 Placement of sediments on-site as beneficial re-use material would be most difficult to implement
3382 relative to the other options given the coordination and approvals required, followed by off-site
3383 disposal via truck, with off-site processing by barge being easiest to implement.

3384 If material stored on site in a stockpile requires future excavation and disposal off-site, it is
3385 relatively easy to implement this remedial action. However, if the material is incorporated as site
3386 fill material beneath structures, roadways, etc. as part of development, it would be very difficult to
3387 remove and take to an off-site location.

3388 **6.2.7 Cost**

3389 **Table 6-3** presents a summary of the costs for each alternative. Costs are presented as total
3390 capital costs and total present-worth for each remedial alternative based on the estimated clean-
3391 up time (USEPA, 2000). The only operations, monitoring, and maintenance costs assumed for

3392 the alternatives are related to the inspections of the sediment stockpile on-site prior to beneficial
3393 re-use on the site. Except for Alternative 6, each alternative has a cost associated with on-site
3394 beneficial reuse of sediments and off-site disposal of sediments. The on-site beneficial reuse of
3395 sediments also includes cost for development of a 5-year stockpile maintenance plan and cost
3396 associated with maintaining the stockpile until the materials are reused on-site. Alternative 6 only
3397 has an off-site disposal cost. The cost baseline is based upon on-site beneficial re-use of
3398 sediments. The cost to dispose of sediments off-site was also analyzed and is presented as a
3399 separate set of cost estimates to provide a sensitivity analysis with respect to the ultimate
3400 disposition of site sediments.

3401 **On-Site Beneficial Reuse of Sediments.** Costs for the alternatives range from \$78.4M to
3402 \$108.7M for on-site beneficial reuse. The least cost alternatives are Alternatives 3 (\$79.4M) and
3403 4 (Geotube, \$78.4M), followed closely by Alternative 5 (\$82.1M), and Alternative 4 (belt filter
3404 press, \$85.5M). These alternatives are very similar in cost, ranging from \$79.4 M to \$85.5 M.
3405 Given the approximate nature of these cost estimates, there is virtually no difference in cost
3406 between Alternatives 3, 4 (belt filter press and Geotube), and 5.

3407 Alternative 2 belt filter press (\$108.7 M) and Geotube (\$95.3 M) are the most expensive options
3408 due to the duration of dredging and equipment costs.

3409 Alternative 6 is not included in the cost analysis for on-site beneficial reuse of sediments because
3410 it relies entirely upon off-site disposal of sediments.

3411 It is important to note these alternatives fall within the cost accuracy range of -30% to +50%.
3412 Applying this range to the lowest cost alternative (Alternative 5) yields an accuracy range of \$54.9
3413 M to \$117.6 M. All other alternative costs fall within this range, suggesting that all alternatives
3414 can be considered cost-effective and that the differences between the alternatives are relatively
3415 minor. Figure 6-1 presents the total cost for each alternative (with both on-site beneficial reuse
3416 and off-site disposal options) with their respective ranges of -30%/+50% accuracy to illustrate that
3417 all remedial alternative costs fall within the CERCLA range of FS accuracy.

3418 **Off-Site Disposal of Sediments.** For Alternatives 2 through 4, off-site disposal generally adds
3419 approximately \$30 to \$35 M relative to the base cost for on-site beneficial reuse. The differences
3420 among the alternatives for these additional costs are primarily related to differences in the amount
3421 of material dredged (more over-dredge for hydraulic as compared with mechanical dredging) and
3422 the need for additives to eliminate free liquids (6% Portland cement added to mechanically
3423 dredged sediments and no additives for either Geotube or belt filter press dewatered sediments).
3424 These additional costs bring the total costs of the alternatives for off-site disposal up to a range
3425 of \$109.7 M to \$142.8 M. Alternative 6, which relies entirely upon transporting sediments via
3426 barge to an off-site processing facility has total estimated costs of \$93.5 M. Alternative 6 is
3427 therefore considered the least cost alternative for off-site disposal. A significant factor in this
3428 reduction in costs is related to the lack of need for on-site infrastructure related to off-loading,
3429 processing, placing, and hauling material. Another factor is the efficiency of barge transport
3430 relative to trucking. The next lowest cost alternative is Alternative 5 (Geotube \$109.7 M) followed
3431 by Alternative 3 (\$112.5 M).

3432 It is important to note that costs of these alternatives (except for Alternative 2, belt filter press) fall
3433 within the FFS accuracy range of -30%/+50% for the lowest off-site disposal alternative. For
3434 example, the -30%/+50% FFS cost accuracy yields a range of \$65.4 M to \$140.2 M for Alternative
3435 6 (lowest off-site disposal alternative). All other alternative costs (except for Alternative 2) fall
3436 within this range, suggesting that most alternatives can be considered cost-effective and that the
3437 differences between the alternatives are relatively minor (see Figure 6-1). .

3438 **7.0 PREFERRED REMEDY**

3439 Based on the rankings presented in **Table 7-1** and the detailed and comparative analyses, the
3440 preferred remedy for the Tidal Flats is Alternative 3, Mechanical Dredging, when coupled with on-
3441 site beneficial re-use of sediments. This option has the highest ranking at a score of 25 points,
3442 with an accuracy range 24 to 26 points, while other options ranged from 14 to 24 points, with
3443 accuracy ranges of 13 to 15 points and 23 to 25 points, respectively³. While the score of this
3444 alternative falls within the accuracy range for Alternative 4, Geotubes, which has a score of 24
3445 points and an accuracy range of 23 to 25 points, there are several advantages including its relative
3446 simplicity which make it the preferred remedy. It is protective of human health and the
3447 environment, complies with ARARs, is cost-effective, and provides the best tradeoffs with respect
3448 to the balancing criteria (as compared with other alternatives) including the best combination of
3449 time to achieve the RAOs, certainty of success, and reliability.

3450 The main factors that differentiate Alternative 3 from other Alternatives include: shortest overall
3451 schedule/highest productivity, lower amount of water incorporated with dredged materials, lower
3452 volume of sediments excavated, easily implemented and less technically complex due to the lack
3453 of need for very large-scale dewatering and water treatment equipment, and lowest overall cost.

3454 The preferred remedy for the Tidal Flats would be coupled with the preferred remedy for Outfall
3455 008, which is mechanical excavation in the dry coupled with on-site beneficial reuse. Only one
3456 Alternative was retained and analyzed for Outfall 008 and therefore rankings were not developed
3457 for this AOC.

3458 **7.1 Preferred Remedy Advantages**

3459 Alternative 3 would utilize the latest technology in environmental dredging by including a precision
3460 low turbidity level cut, environmental clamshell bucket. This equipment minimizes overdredge,
3461 reducing the amount of dredged materials generated, minimizes the generation of resuspended
3462 sediment relative to other mechanical dredging technologies and mixing of underlying clean
3463 sediments, and entrains a much lower amount of water (orders of magnitude) with dredged
3464 materials relative to hydraulic dredging, particularly when operated by experienced, qualified
3465 contractors.

3466 In addition, Alternative 3 has the highest anticipated productivity rate which would result in the
3467 overall shortest schedule as compared with other alternatives. Alternative 3 provides these
3468 benefits at a cost that is nearly lowest among all the alternatives evaluated (only Alternative 4,

³ The development of scores for alternatives is by its nature highly subjective; however, it provides a useful framework for categorizing and organizing the performance of various alternatives with respect to the evaluation criteria. Using the 0 to 4-point scale for each criterion, total scores within one point of each other can be considered essentially the same due to the subjective nature of this evaluation. The score itself is not the final decision factor in selecting a remedy. Rather, it helps to identify the major advantages and disadvantages among the alternatives to be discussed as part of the preferred remedy.

3469 Mechanical Dredging with Hydraulic Transport of sediments and Geotubes is slightly lower by
3470 \$1M) while completing the work in less time and performing the work more accurately.

3471 The technologies for Alternative 3 are readily available and are easily implemented. Alternative 3
3472 would generate a significantly lower volume of water relative to hydraulic dredging and hydraulic
3473 transport options. Operation of this alternative will be less complex than other alternatives and
3474 its on-site footprint will be less than hydraulic transport options because of the lack of a large,
3475 complex dewatering and water treatment system.

3476 Generation of turbidity can be minimized through proper operation of the equipment and selection
3477 of an experienced dredging contractor and can be adequately controlled via silt curtain technology
3478 as part of a turbidity monitoring, management, and maintenance program. Dredged materials will
3479 require Portland cement solidification because gravity drainage alone will not reduce free liquids
3480 sufficiently; however, this is a standard element of dredged material processing and not difficult
3481 to incorporate.

3482 Finally, under Alternative 3, sediment that is beneficially reused on-site requires solidification
3483 which provides the added benefit of increased strength (which is likely required for future
3484 development purposes) and its capacity to entrain and isolate contamination. Alternative 3
3485 includes solidification with Portland cement at 6% and will generate a material that would achieve
3486 typical UCS required for on-site use, while other options (Alternative 2 and 4) do not include
3487 strengthening additives. These factors additionally make Alternative 3 most preferable.

3488 For off-site disposal, Alternative 6 (Mechanical Dredging with Off-site Disposal via Barge) is the
3489 preferred remedy because of its cost-effectiveness. This alternative achieves many of the same
3490 benefits as Alternative 3 (on-site beneficial reuse). In addition, when Alternative 6 is compared to
3491 alternatives that utilize hydraulic dredging or hydraulic transport followed by mechanical
3492 dewatering technologies, the additional costs for dewatering and added complexity are not
3493 justified. These dewatering technologies have the potential to reduce the amount of dewatered
3494 material disposed of off-site by achieving higher percent solids as compared with gravity drainage
3495 (Alternatives 3 and 6). Finally, Alternative 6 would have a minimal on-site footprint, with the lowest
3496 short-term impacts to the Site and local community because it is primarily a water-based
3497 operation.

3498 **7.2 Criteria-Specific Rankings**

3499 This subsection describes the differences among the alternatives that were used to develop the
3500 scores for each alternative as presented on Table 7.1.

3501 **7.2.1 Overall Protection of Human Health and the Environment, Compliance with** 3502 **ARARs, and Long-term Effectiveness**

3503 All Alternatives were scored the same with respect to the first three of the seven criteria: Protection
3504 of Human Health and the Environment, Compliance with ARARs, and Long-term Effectiveness.

3505 All alternatives were rated high because they all adequately protect human health and the
3506 environment, comply with ARARs, and remove all impacted sediments from the Site. As a result,
3507 each alternative was scored “high” and scored four points each in each of these categories.

3508 **7.2.2 Reduction of Toxicity, Mobility or Volume through Treatment**

3509 Mechanically dredged sediments (Alternative 3, 5, and 6) scored highest under this criterion and
3510 each received a rating of “moderate to high,” or three points. These alternatives all have the
3511 advantage of the ability to dredge less materials than hydraulic dredging based upon the accuracy
3512 of the equipment. For purposes of this FFS, the overdredge quantity of 0.2 ft results in an
3513 additional volume of approximately 16,100 cy for Alternative 3, 4, 5, and 6, while an assumed
3514 overdredge of 0.4 ft results in an additional volume of 30,800 cy (Alternative 2) over the neat
3515 volume of approximately 140,000 cy. These differences are reflected in the scores.

3516 Hydraulically conveyed sediments (Alternatives 2 and 4) treated via Geotubes also scored
3517 “moderate to high” and received three points each. This score reflects the fact that while
3518 Alternatives 3, 5, and 6 generated the lowest amount of water to be treated, the addition of
3519 Portland cement was found to be necessary, which generally slightly increases the volume of
3520 materials. Alternative 3, 4, 5, and 6 also have the added advantage of less mixing of underlying
3521 clean sediments as compared with Alternative 2 (see **Appendix E**, Dredging Alternative
3522 Evaluation, **Table 7**, “Point of Dredging”).

3523 For Alternatives relying upon belt press or Geotube technology, Portland cement addition was not
3524 found to be necessary to eliminate free liquids. However, these same alternatives were deducted
3525 a point each due to the results of the treatability testing which showed that the pressate from the
3526 belt press contained dissolved PCBs above state surface water SB standards (see **Table C-12** of
3527 **Appendix C**) in both unfiltered and filtered samples whereas Geotube filtrate did not contain
3528 PCBs. Furthermore, hydraulically dredged sediments (Alternative 2) were deducted an additional
3529 point due to the extra volume that would be removed due to the lower dredging accuracy of this
3530 equipment relative to a precision mechanical bucket. Therefore, Alternative 2 was assigned “low
3531 to moderate” (one point) and “moderate” (two points) for belt press and Geotube dewatering,
3532 respectively.

3533 **7.2.3 Short-term Effectiveness**

3534 The scoring for short-term effectiveness was heavily influenced by the anticipated schedule (time
3535 to achieve RAOs). Alternatives relying upon mechanical dredging all scored “moderate to high”
3536 or three points each based upon the estimated time frame of three to four seasons to complete
3537 the work. None of the on-site beneficial re-use options scored a “high” rating (four points) due to
3538 this long-time frame and the amount of on-site infrastructure needed to complete the work (related
3539 to short-term impacts to workers and the local community). Alternative 6 scored “high” because
3540 of its lack of on-site infrastructure, minimizing local impacts and the time required to mobilize and
3541 demobilize from the site.

3542 Alternative 2, Hydraulic Dredging, was rated lowest, due to its anticipated longer time resulting
3543 from lower productivities (four to five seasons vs. three to four seasons for mechanically dredged

3544 materials). Furthermore, alternatives (Alternatives 2 and 4) that rely upon belt press technology
3545 were scored lower than their Geotube counterparts due to increased short-term impacts to the
3546 site and workers related to the larger footprint required for dewatering and potentially water
3547 treatment (truck traffic, increased noise, and worker safety issues). Alternatives 2 and 4 were
3548 scored “low” (zero points) and “moderate” (two points), respectively, for the belt press option, and
3549 “low to moderate” (one point) and “moderate to high” (three points), respectively, for the Geotube
3550 option to account for these factors.

3551 Alternatives 3, 5 and 6 all scored similarly for short-term effectiveness since they all incorporated
3552 mechanical dredging as the sediment removal method. However, Alternative 6 ranked the highest
3553 in short term effectiveness due to barging sediment off-site.

3554 **7.2.4 Implementability**

3555 Alternative 3 was rated “moderate to high” (three points), higher than any other on-site options
3556 due to the relatively lower level of complexity, in total, of this alternative as compared with other
3557 options. Alternatives 2 and 4 (Geotube) were both rated “moderate” (two points) to reflect
3558 increased complexity of the alternative related to dredging technology, dewatering, and water
3559 treatment relative to Alternative 3. Alternatives 2 and 4 (belt press) were rated lower than their
3560 Geotube counterparts due to the increased complexity of operation related to belt press
3561 technology. Another subtle factor which is considered when comparing Alternatives 2 and 4 is
3562 the balance between established technologies of hydraulic dredging and mechanical dredging
3563 and the innovative nature of the mechanical dredging/hydraulic transport approach, which
3564 balances the scores for these two options (both receiving the same scores of “low to moderate”
3565 and “moderate” for belt press and Geotube technology, respectively).

3566
3567 Alternative 5 is scored “moderate” (two points) to reflect two balancing factors relative to other
3568 alternatives. The technology is relatively unproven within the United States which results in a lack
3569 of availability of this technology (only one contractor is known to exist on the East coast); however,
3570 the alternative does not rely on extensive dewatering and water treatment technologies.

3571
3572 When off-site disposal is considered, Alternative 6 is considered the most easily implemented due
3573 to its limited need for on-site infrastructure.

3574 **7.2.5 Cost**

3575
3576 Alternatives 3 and 4 (Geotube) both scored “high” (four points) based on their very similar lowest
3577 total capital costs (\$79.4 vs. \$78.4M, respectively). These alternatives achieve these costs
3578 through high productivity and lower volume (Alternatives 3 and 4), low volume of water for
3579 treatment (Alternative 3) and ease of operation (Alternative 4, geotubes). However, it is important
3580 to note that while Alternative 3 includes the addition of 6% Portland cement, Alternative 4 does
3581 not, which, if required to meet on-site strength requirements, could add several million dollars to
3582 the overall cost. The next lowest cost alternatives, Alternatives 5 (\$82.1M, including 6% Portland
3583 cement) and 4 (belt press, \$85.5M, no Portland cement) were scored “moderate” (two points)
3584 followed by Alternative 2 (\$95.3M, geotubes, no Portland cement) “low to moderate” (one point)
3585 and Alternative 2 (\$108.7M, belt press, no Portland cement) “low” (zero points).

3586
3587 Among the off-site disposal options. Alternative 6 scored highest based on its lowest overall cost
3588 of \$93.5M.

3589
3590 **7.3 Conclusion**

3591 The preferred remedy for the SAEP tidal flats and Outfall 008 dredging is Alternative 3,
3592 Mechanical Dredging coupled with on-site beneficial reuse. Alternative 3 would provide protection
3593 to human health and the environment, would comply with ARARs, and provides the best mix of
3594 tradeoffs among the balancing criteria. Alternative 3 would minimize environmental impacts by
3595 utilizing precision mechanical dredging technology which reduces resuspension and residuals.
3596 Alternative achieves these benefits by minimizing the volume of sediments removed through the
3597 most accurate dredging technology available and by minimizing the amount of water entrained
3598 with sediments. Alternative 3 also would minimize impacts by completing the work in the shortest
3599 overall schedule, which is estimated to be three to four seasons for a seven-month working
3600 window and two years if the work schedule can be expanded to seven days per week and 24
3601 hours per day. If twelve months per year working time are permitted, then the schedule could
3602 shorten even further to approximately eighteen months. Finally, Alternative 3, when coupled with
3603 on-site beneficial reuse, would generate sediments processed with Portland cement that can
3604 readily be reused at the site for most redevelopment purposes.

3605 Should off-site disposal of all sediments be required, Alternative 6, Mechanical Dredging followed
3606 by off-site disposal via barge transport is the preferred remedy.

ARAR Logic Flowchart

For Determining if a Requirement is an ARAR

- (1) Promulgated means the requirement is of general applicability and legally enforceable. In general, regulations have gone through the formal administrative procedures to make them legally enforceable. Guidance documents are not promulgated.
- (2) See NCP criteria for relevant and appropriate discussed below or in 40 CFR 300.400(g)(2).
- (3) MMRP sites are treated as CERCLA sites, by policy, regardless of whether or not a hazardous substance, pollutant, or contaminant has been released (ER-2003-1).
- (4) "Hazardous substances" are defined in CERCLA 101(14) and 40 CFR 300.5 and listed by chemical name in 40 CFR 302.4.
- (5) "Pollutant or contaminant" is defined in CERCLA 101(33) and 40 CFR 300.5 and response authority is limited to pollutants and contaminants that "may present an imminent and substantial danger to public health or welfare of the United States."
- (6) ARARs are identified for actions which occur onsite. Off-site activities must comply with all applicable requirements, but are not subject to designation of ARARs.

TABLES

**Table 2-1
Applicable or Relevant and Appropriate Requirements
Stratford Army Engine Plant
Stratford, Connecticut**

REGULATORY AUTHORITY	CHEMICAL, ACTION, OR LOCATION SPECIFIC	REQUIREMENT	STATUS	REQUIREMENT SYNOPSIS	ACTION TO BE TAKEN TO ATTAIN REQUIREMENT	APPLICABLE TO ALTERNATIVE
Federal	Action	The Resource Conservation and Recovery Act (RCRA) Subtitle C (Hazardous Waste), Section 268, Land Disposal Restriction	Relevant and Appropriate	The Resource Conservation and Recovery Act (RCRA) (42 U.S.C. §6901 et seq.) was established in 1976 to control non-hazardous and hazardous wastes, including the generation, transportation, treatment, storage and disposal of hazardous wastes. . The 1984 amendments to RCRA granted the U. S. Environmental Protection Agency (USEPA) expanded authority to require corrective action at permitted and non-permitted treatment, storage, and disposal facilities. Section 268 identifies hazardous wastes or other designated wastes that are restricted from land disposal and defines those limited circumstances under which an otherwise prohibited waste may continue to be land disposed	RCRA Subtitle C (hazardous waste) will apply to the generation, transportation, treatment, storage, and disposal of any hazardous wastes that are generated during the course of remedial activities. This includes managing hazardous wastes or other wastes that exhibit the toxicity characteristic for metals or contain PCBs on-site as well as off-site at treatment, storage, or disposal facilities. RCRA hazardous wastes include both listed (specific lists of wastes from non-specific sources, specific sources, and discarded commercial chemical products) and characteristic (toxic, ignitable, corrosive, or reactive, as determined through testing). Dredged material will need to be properly categorized according to RCRA requirements.	No hazardous wastes are anticipated. Applicable only to off-site disposal activities.
Federal	Action	RCRA Subtitle D (Non-Hazardous Waste), Sections 239: State Permit Program Determination of Adequacy and Section 258: Criteria for Municipal Solid Waste Landfills		RCRA Subtitle D specifies the requirements that state permit programs must meet to be determined adequate by the EPA under section 4005(c)(1)(C) of RCRA and the procedures EPA will follow in determining the adequacy of state permit programs to regulate and non-hazardous waste disposal facilities, including Municipal Solid Waste Landfills	RCRA Subtitle D applies to the regulation of the disposal of all non-hazardous solid waste generated from remediation activities, including the applicability of state agencies regulating and enforcing RCRA requirements. Waste materials (other than materials to be beneficially reused) will need to be disposed of at facilities properly permitted by the State under RCRA.	Applicable to off-site disposal activities

**Table 2-1
Applicable or Relevant and Appropriate Requirements
Stratford Army Engine Plant
Stratford, Connecticut**

REGULATORY AUTHORITY	CHEMICAL, ACTION, OR LOCATION SPECIFIC	REQUIREMENT	STATUS	REQUIREMENT SYNOPSIS	ACTION TO BE TAKEN TO ATTAIN REQUIREMENT	APPLICABLE TO ALTERNATIVE
Federal	Action	The Clean Water Act (CWA) 33 U.S.C. §1251 et seq. (1972) CWA Section 404 Permit Program	Applicable	<p>The Clean Water Act (CWA) (33 U.S.C. §1251 et seq.1972), establishes the regulatory structures controlling discharge of pollutants and regulation of water quality in surface waters of the U.S. Permitting actions under different sections of the CWA are implemented by different agencies and will be potentially applicable to the various remediation alternatives considered, and ultimately implemented, for the Housatonic River a designated navigable water of the U.S.</p> <p>The basic premise of the program is that no discharge of dredged or fill material may be permitted if: (1) a practicable alternative exists that is less damaging to the aquatic environment or (2) the nation's waters would be significantly degraded. Permits are required to demonstrate that impacts have been avoided to the maximum extent practicable:</p>	<p>Section 404 of the CWA establishes the permit program whereby USACE regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands and other aquatic areas). USACE conducts a "public interest review" of proposed actions to evaluate the benefits of a proposed activity against its potential detrimental impacts. USACE must determine that an applicant has taken all appropriate and practicable steps, including evaluating alternatives, to avoid and minimize adverse impacts to waters of the United States, and that unavoidable impacts are appropriately mitigated, including compensatory mitigation where deemed necessary. The USACE New England District has issued a General Permit for the State of CT authorizing categories of activities in both inland and tidal waters which meet the conditions of the General Permit as either Category 1 (self-verification notification required) or Category 2 (application to and written approval from USACE required). Activities that do not meet the conditions of the General Permit Category 1 or 2 require an Individual Permit, including public notice and a public comment period.</p> <p>The USACE General Permit serves as authorization under Section 404 of the CWA, as well as authorization for regulated activities under Section 10 of the Rivers and Harbors Act of 1899 and Section 103 of the Marine Protection, Research and Sanctuaries Act (MPRSA). In addition, USACE requires and evaluates compliance with several other federal laws, including as applicable (but not necessarily limited to) Sections 401 and 402 of the CWA, Section 307(c) of the Coastal Zone Management Act, the National Historic Preservation Act, the Endangered Species Act, the Fish and Wildlife Act, the Marine Mammal Protection Act, the Magnuson-Stevens Act and the Wild and Scenic Rivers Act, as well as applicable Executive Orders. Remediation activities requiring either dredge or fill activities in the Housatonic River will require authorization from USACE under Section 404 of the CWA. The level of permit required will depend on the regulated remedial alternative selected.</p> <p>Substantive requirements cover dewatering, barge transportation, disposal of dredged sediment, and discharge of treated waters back to the Housatonic.</p>	All alternatives will meet the definition of discharging dredged or fill material into waters of the U.S.

**Table 2-1
Applicable or Relevant and Appropriate Requirements
Stratford Army Engine Plant
Stratford, Connecticut**

REGULATORY AUTHORITY	CHEMICAL, ACTION, OR LOCATION SPECIFIC	REQUIREMENT	STATUS	REQUIREMENT SYNOPSIS	ACTION TO BE TAKEN TO ATTAIN REQUIREMENT	APPLICABLE TO ALTERNATIVE
Federal	Action	The Clean Water Act (CWA) 33 U.S.C. §1251 et seq. (1972) CWA Section 401 Certification		Section 401 of the CWA requires that any activity requiring a federal license or permit, which may result in any discharge into waters of the U.S., receive certification from the state in which it is to be located that such discharge will comply with applicable water quality standards. This certification is known as a Water Quality Certificate (WQC), and is issued by the appropriate state authority.	Under Section 401, a federal agency cannot issue a permit or license for an activity that may result in a discharge to waters of the U.S. until the state (or tribe) where the discharge would originate has granted or waived Section 401 certification. Granting certification, with or without conditions, allows the federal permit or license to be issued consistent with any conditions of the certification. States (and Tribes) make their decisions to deny, certify, or condition permits or licenses based in part on the proposed project's compliance with EPA-approved water quality standards and whether the activity leading to the discharge will comply with any applicable effluent limitations guidelines, new source performance standards, toxic pollutant restrictions, and other appropriate requirements of state or tribal law.	All alternatives will require Water Quality Certification substantive compliance
Federal	Action	The Clean Water Act (CWA) 33 U.S.C. §1251 et seq. (1972) CWA Section 402 National Pollutant Discharge Elimination System Program		Section 402 of the CWA establishes the National Pollutant Discharge Elimination System (NPDES) Program, which requires a permit for discharge of any pollutant to waters of the U.S. Discharges requiring permits include industrial, municipal, agricultural, stormwater, and commercial vessel wastewaters. The state of CT has permitting authority under the NPDES Program and issues general and individual permits through CTDEEP.	Under Section 402, stormwater discharge activities require compliance with state and federal NPDES regulations. A permit will be required from CT DEEP for applicable discharges. All substantive requirements will be met.	All alternatives have the potential to release stormwater into local surface waters and will comply with substance requirements
State	Location	Connecticut Coastal Management Act (CCMA) (P.A. 78-15, 1979, as amended) Section 22a – 94 through 100 and Section 22a - 361	Applicable	Coastal management in Connecticut is administered by the Department of Energy and Environmental Protection (DEEP) and is approved by NOAA (National Oceanic and Atmospheric Administration) under the federal Coastal Zone Management Act. Under the statutory umbrella of the Connecticut Coastal Management Act (CCMA), enacted in 1980, DEEP regulates work in tidal, coastal and navigable waters and tidal wetlands.	Section 22a 94 through 100 regulates coastal area remediation activities that will need to undergo federal consistency review relative to the CT program. The standards and criteria of various enumerated state environmental permitting and licensing laws and regulations ("core laws") serve as the enforceable policies of the CT Coastal Program. Thus, approval of state permits required to be obtained by a core law require the State's consistency concurrence. Sec. 22a-36 covers permits for dredging, structures, placement of fill, obstruction or encroachment, or mooring area or facility. Activities require the submittal of an application to DEEP for applicable work. Applicants must agree to carry out any conditions necessary to the implementation of such certificate or permit.	All

**Table 2-1
Applicable or Relevant and Appropriate Requirements
Stratford Army Engine Plant
Stratford, Connecticut**

REGULATORY AUTHORITY	CHEMICAL, ACTION, OR LOCATION SPECIFIC	REQUIREMENT	STATUS	REQUIREMENT SYNOPSIS	ACTION TO BE TAKEN TO ATTAIN REQUIREMENT	APPLICABLE TO ALTERNATIVE
State	Chemical	Remediation Standard Regulations RCSA §22a-133k-2 (c) (all); especially Polluted Soil definitions and requirement; Appendix B Pollutant Mobility criteria	Relevant and Appropriate	These regulations were adopted on January 30, 1996 and amended on June 27, 2013, under the statutory authority provided by CGS §22a-133k. They provide specific numeric cleanup criteria for a wide variety of contaminants in soil, ground water, surface water and soil vapor. Copies of the regulation are available from http://eregulations.ct.gov/eRegsPortal/Browse/RCSA/%7BEAD3787B-7651-4803-8239-CCD2B569E8A0%7D DEEP web page with associated information is http://www.ct.gov/deep/cwp/view.asp?a=2715&q=325012&deepNav_GID=1626	Sediments placed on land at the site will meet CT RSRs for leaching to groundwater. Placement of sediment on land will follow the requirements for placing "polluted soil" on land, including meeting SPLP standards, required separation from the groundwater table, and engineering controls.	Relevant to any alternative where processed sediments are placed on land at the site.
State	Action	Connecticut Water Quality Standards CGS §22a-426 RCSA §22a-426-4 (Surface Waters), 22a-426-8 (Antidegradation Standards) and 22-426-9 (Environmental Criteria)	Potentially Applicable	Connecticut's Water Quality Standards Regulations were initially adopted effective October 10, 2013 (last updated 11/21/2015), superseding earlier WQS adopted under the statute but not in the same regulatory form. They establish specific numeric criteria, designated uses, and antidegradation policies for groundwater and surface water. Statute available at https://www.cga.ct.gov/current/pub/chap_446k.htm#sec_22a-426 . A summary of the WQS is available from DEEP's website at http://www.ct.gov/deep/cwp/view.asp?a=2719&q=325618&deepNav_GID=1654 .	Discharges to Housatonic River will meet the substantive requirements for surface water discharges, antidegradation standards, and environmental criteria.	All alternatives impact surface waters through dredging, filling, and discharging.
State	Action	Hazardous Waste Management: Generator Standards RCSA §22a-449(c)102	Potentially applicable	This section establishes standards for various classes of generators. The standards of 40 CFR §262 are incorporated by reference. Storage requirements given at 40 CFR §265.15 are also included. Current regulations are available at http://eregulations.ct.gov/eRegsPortal/Browse/RCSA?id=Title%2022a 22a-449%28c%29 22a-449c-102 22a-449c-102	Waste stored at the site will be stored in accordance with these requirements.	Potentially all alternatives.
State	Action	Hazardous Waste Management: Land Disposal Restrictions RCSA §22a-449(c)108(a)(2)(V)	Potentially applicable	This section incorporates by reference the Federal Land Disposal Restrictions given at 40 CFR §268. See http://eregulations.ct.gov/eRegsPortal/Browse/RCSA?id=Title%2022a 22a-449%28c%29 22a-449c-108 22a-449c-108	If applicable, land disposal restrictions will be followed.	Potentially all alternatives.

**Table 2-1
Applicable or Relevant and Appropriate Requirements
Stratford Army Engine Plant
Stratford, Connecticut**

REGULATORY AUTHORITY	CHEMICAL, ACTION, OR LOCATION SPECIFIC	REQUIREMENT	STATUS	REQUIREMENT SYNOPSIS	ACTION TO BE TAKEN TO ATTAIN REQUIREMENT	APPLICABLE TO ALTERNATIVE
State	Action	Disposition of PCBs CGS §§22a-463 through 469. Disposition of PCB regulated by §22a-467	Potentially applicable – depending on alternatives analyzed.	This section requires that PCBs be disposed under a permit issued by the Commissioner. PCBs may also be disposed of under a written approval of the Commissioner in a manner which results in the destruction of the PCB or in a manner not inconsistent with the Requirements of the Toxic Substances Control Act (TSCA), listed at 40CFR §761. This section of the Statutes is available at https://www.cga.ct.gov/current/pub/chap_446k.htm#sec_22a-463	PCBs will be disposed of in accordance with state and federal regulations (TSCA). PCBs between 1 and 50 mg/kg and PCBs > 50 mg/kg will be segregated for proper disposal apart from sediments containing <1 mg/kg PCBs	All removal alternatives.
State	Chemical	Air Pollution Control Control of Organic Compound Emissions RCSA §22a-174-20	Potentially relevant and appropriate.	This section regulates volatile organic compounds. Subsection (f) sets limits for emission of organic solvents. See http://eregulations.ct.gov/eRegsPortal/Browse/RCSA?id=Title%2022a 22a-174 22a-174-20 22a-174-20	Although not anticipated, any emissions of organic solvents exceeding thresholds will be properly controlled and/or treated. Will need to be evaluated at design and implementation stage depending on exact processes to be used.	Potentially all.
State	Action	Regulation of Dredging and Erection of Structures and Placement of Fill in Tidal, Coastal, or Navigable Waters CGS §§22a-361	Potential ARAR – depending on alternatives analyzed.	These statutes regulate dredging, the erection of structures and placement of fill in tidal, coastal or navigable waters waterward of the high tide line. Section 361 Restricts dredging, erecting any structure, placing any fill, obstructing or encroaching or carrying out any work incidental to these activities, in the tidal, coastal or navigable waters of the state waterward of the coastal jurisdiction line until such person, firm or corporation has submitted an application and has secured from DEEP a certificate or permit for such work and has agreed to carry out any conditions necessary to the implementation of such certificate or permit.	Dredging and capping work will following substantive requirements.	All
State	Action	Tidal Wetlands Statutes CGS §§22a-32	Potential ARAR	These statutes regulate activities within tidal wetlands. Sec. 22a-32. Regulates work in tidal wetlands and states that “No regulated activity shall be conducted upon any wetland without a permit. Any person proposing to conduct or cause to be conducted a regulated activity upon any wetland shall file an application for a permit with the commissioner, in such form and with such information as the commissioner may prescribe”.	Substantive requirements will be met.	All

**Table 2-1
Applicable or Relevant and Appropriate Requirements
Stratford Army Engine Plant
Stratford, Connecticut**

REGULATORY AUTHORITY	CHEMICAL, ACTION, OR LOCATION SPECIFIC	REQUIREMENT	STATUS	REQUIREMENT SYNOPSIS	ACTION TO BE TAKEN TO ATTAIN REQUIREMENT	APPLICABLE TO ALTERNATIVE
State	Location	Standards for flow of water in rivers or streams RCSA §§ 26-141b-4	To be considered	<p>These statutes provide for establishment of standards for flow of water in rivers or streams and regulations to implement these standards. Section 26-141(b)-4 establishes streamflow standards and regulations for various classes of rivers and stream segments. See the statutes at:</p> <p>Stream Flow Standards and Regulations are at https://eregulations.ct.gov/eRegsPortal/Browse/RCSA/%7B95FC4BE3-B209-4B6B-B103-E54948C7AC1C%7D</p> <p>General information can be found at http://www.ct.gov/deep/cwp/view.asp?a=2719&q=434018&deepNav_GID=1654</p>	Substantive requirements will be met.	All
State	Action	Air Pollution Control Control of Odors RCSA §22a-174-23	Relevant and Appropriate	<p>No person shall cause or permit the emission of any substance or combination of substances which creates or contributes to an odor, in the ambient air, that constitutes a nuisance.</p> <p>Air Pollution Control, Control of Odors can be found at: http://www.ct.gov/deep/lib/deep/air/regulations/mainregs/sec23.pdf</p>	If applicable, odor control will be implemented.	Relevant to any alternative where sediments are processed and/or placed on land at the site.
Federal	Chemical	Toxic Substances Control Act (TSCA) PCB Remediation Wastes 40 CFR 761.61, 761.79	To be considered	<p>Identifies storage, disposal, and decontamination requirements for various PCB waste types and specifies requirements for PCB remediation waste. PCB remediation waste is defined as waste containing PCBs as a result of a spill, release, or other unauthorized disposal at the following concentrations:</p> <ul style="list-style-type: none"> • Materials disposed of prior to April 18, 1978, that are currently at concentrations > 50 ppm PCB, regardless of the concentrations of the original spill; • Materials currently at any volume or concentration where the original source was >500 ppm PCB beginning on April 18, 1978, or > 50 ppm PCB beginning on July 2, 1979; and • Materials currently at any concentration if the PCBs are from a source not authorized for use. <p>Dredged materials are specifically regulated.</p>	<p>Dredged materials will be managed as PCB remediation wastes based on the concentrations at which the PCBs are found, as opposed to their original concentration.</p> <p>Requires coordination with USEPA TSCA Regional coordination per guidance to determine applicability and path forward.</p>	All

Notes/Abbreviations:

ARAR = Applicable or Relevant and Appropriate Requirement
 CFR = Code of Federal Regulations
 RSR = Remediation Standard Regulations
 TSCA = Toxic Substances Control Act
 PCBs = Polychlorinated Biphenyls

**Table 3-1
General Response Action Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action	Description	Effectiveness	Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
					Tidal Flats	OF-008 Drainage Ditch	
INSTITUTIONAL CONTROLS	Physical or administrative restrictions designed to prevent exposure to impacted sediment	Limited Effectiveness. Can be a useful tool to educate the public about the Site, however with future development requirements, future access restrictions, easements, covenants and regulatory restrictions cannot be enforced. Not effective for reducing ecological risks.	Variable Difficulty. It can be easy to implement educational programs however it would be difficult to enforce land use restrictions with future development needs.	Low	No	No	Sediment removal is required, therefore, screened out except as a necessary ancillary component of remedial alternatives.
MONITORED NATURAL RECOVERY	Allowing ongoing, naturally-occurring processes (reduction through deposition of incoming "cleaner" sediment, and/or dilution) to reduce constituent concentrations in sediment. Includes long-term monitoring to document decline in constituent concentrations.	Effective. Likely would be effective in the long term. Not effective in the short term. Time for Site to meet remedial goals unknown but estimated to be on the order of 20 to 80 years.	Low Difficulty.	Low	No	No	Will not meet RAOs in a reasonable time frame. Long term monitoring required to document recovery.
CONTAINMENT	Containment is accomplished by placing clean material over sediment within the areas of concern. Placement thicknesses vary and materials can range from silty sand to gravel. The containment cap may include multiple layers of various materials including armoring materials such as rip rap, a chemical isolation layer, and a chemical treatment layer to treat dissolved and/or migrating site contaminants. Cap materials would be selected to prevent erosion of underlying contaminated sediment and include a habitat, or bioactive, zone as well as armoring to keep cap materials in place. Delivery methods could include mechanical or hydraulic methods.	Effective. A cap would provide immediate isolation of contaminated sediment and prevent resuspension of contaminated bottom sediment. Treatability and engineering studies would be required during design phase to determine optimum cap material(s) and thicknesses. Cap thickness would need to be constructed in a manner to allow for boat traffic with possible access restrictions. Bench- or pilot-scale studies may be required to determine the effectiveness of different capping materials, cap placement, and construction. Flux of dissolved phase constituents to the tidal flats is not a concern at this Site.	Moderate Difficulty. Requires specialized equipment to place cap material. Could require several "lifts" or application of one layer at a time. May require construction of staging areas and access roads. Water level that varies may make application more difficult, depending on application method and variation in water levels. Containment without dredging will raise bottom bathymetry. Capping design can be complicated.	Moderate	No	No	Containment as a remedy that leaves behind contamination has been eliminated from further consideration. Straight backfill of removal areas will be a necessary component for inclusion in removal alternatives.

**Table 3-1
General Response Action Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action	Description	Effectiveness	Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
					Tidal Flats	OF-008 Drainage Ditch	
IN-SITU TREATMENT	Placement of a substrate, such as activated carbon or other specialized media, to reduce bioavailability of site contaminants.	Variable Effectiveness. Reduces exposure/bioavailability of contaminants to benthic organisms. Has been demonstrated for PCBs and some metals; however, effectiveness is not known for all contaminants. Amended sediment may not be good substrate for benthic organisms. Bench and pilot studies may be needed to appropriately design a remedy.	Moderate Difficulty. Easily implemented within the tidal flats and drainage ditch; however, repeated applications may be needed over a long period of time.	Moderate	No	No	Site contaminants would not be removed. Effectiveness at reducing bioavailability is uncertain for all contaminants. Doesn't address risk to benthic organisms.
REMOVAL	Physical removal of contaminated material including hydraulic and mechanical dredges, traditional excavator, cranes, and amphibious/multipurpose dredges. Typical controls may be required for all removal technologies to reduce impacts on water quality, marine plants, and species. Controls may include various types of resuspension controls and fish exclusion barriers.	Effective. Using appropriate technology, can effectively reduce the volume of contaminated sediment with precise GPS assisted removal.	Moderate- High Difficulty. Typically requires construction of supporting infrastructure such as access roads, staging areas, piping, and offloading facilities for dredged sediment. Requires engineering controls to reduce impacts of suspended sediments. Sediment dewatering and water treatment are typically required. Disposal or re-use of sediment is an important consideration.	Moderate-High	Yes	Yes	Proven technology for sediment removal
MATERIAL TRANSPORT	Required to move the removed sediment from the water to land for processing and disposal or reuse. Material is loaded to a barge or scow by mechanical methods, conveyed through a pipeline hydraulically or pneumatically, and/or directly placed in trucks for transport. The barge or scow is maneuvered using tug and/or push boats to the transloading area. Requires landside bulkhead, pier or wharf for barge docking and off-loading.	Effective. Very effective in areas with space and adequate draft. Methods are proven and well-established.	Moderate Difficulty. Can be implemented with various removal technologies to transfer removed sediments. Barge/scow limited by water depth and landside access. Multiple logistical concerns based on-site access and productivities	Moderate-High	Yes	Yes	Universal transportation methods for sediment removal projects.

**Table 3-1
General Response Action Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action	Description	Effectiveness	Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
					Tidal Flats	OF-008 Drainage Ditch	
MATERIAL DEWATERING AND PROCESSING	Multiple process options are available to dewater sediment, treat wastewater, and process sediment. Water treatment options include pH adjustment, flocculants, settling, clarification, carbon adsorption. Dewatering options include gravity dewatering, Geotubes, belt press, plate and frame press and others.	Effective. These technologies are proven and widely available to process sediment and wastewater prior to discharge. Bench-scale studies are typically required to determine which process options best meet project objectives including discharge criteria and disposal objectives.	Variable Difficulty. Will depend on the dredge method selected. Size of treatment systems dictated by volume of water, throughput, and complexity of needed processing systems. Various options for solidification are available. Permit discharge requirements will determine the treatment processes necessary prior to discharge. Water treatment systems can be land-based or barge-based. Discharge may be to local POTW or back to site surface waters. Stabilization technologies are generally easily implemented.	Low-High	Yes	Yes	Required for any option that includes sediment removal
DISPOSAL, RE-USE, AND PLACEMENT	<p>Disposal of excavated material at a permitted landfill or appropriate re-use on-or off-site following implementation of removal options identified above.</p> <p>Removed material that meets beneficial reuse limitations (both chemical and physical) can be transported to pre-approved locations for re-use rather than disposal or placed and managed on-site as fill material to be used in future development. Examples of off-site beneficial reuse include landfill daily cover or roadway base, mine reclamation, or other impaired site fill.</p> <p>Off-site disposal includes both TSCA and non-TSCA landfills based upon PCB concentrations in sediments.</p> <p>Also includes placement of sediments within a confined disposal facility (CDF) or confined aquatic disposal (CAD) cell.</p>	<p>Effective. An effective use of treated sediment. Sediments re-used on-site would need to meet SPLP standards.</p> <p>Landfill technology is effective at eliminating exposure to contaminated sediment and controlling any leachate generated.</p> <p>CAD and CDF technologies can be very effective when properly designed and implemented.</p>	<p>Low-High Difficulty. Would likely require physical conditioning in the form of dewatering and drying and addition of amendments such as lime or Portland cement to meet physical acceptance criteria either on-site or off-site.</p> <p>Off-site disposal requires extensive waste characterization sampling.</p> <p>CDF Implementability can be difficult due to encroachment into waterways.</p> <p>CAD cells can be difficult to implement due to public perception, extension coordination among agencies, and identifying a suitable location.</p>	Low-moderate	Yes	Yes	Necessary options for disposition of removed sediment.

**Table 3-1
General Response Action Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action	Description	Effectiveness	Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
					Tidal Flats	OF-008 Drainage Ditch	
HABITAT RESTORATION	<p>Activities completed to mitigate short-term impacts of remedial actions to local habitat.</p> <p>Re-establish stable cross section following remediation.</p> <p>Reestablish trees, shrubs, forbes, grasses and sedges depending on the ecological zone and restoration objectives. May include invasive species management.</p>	<p>Moderately Effective. Habitat restoration is a proven, documented practice; however, monitoring and maintenance is required to ensure success.</p> <p>Must be designed and installed by qualified, experienced personnel.</p>	<p>Moderate Difficulty. Can require significant coordination and planning with agencies.</p>	Moderate	No	Yes	Necessary for the OF-008 drainage ditch.

**Table 3-2
Initial Technology Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action and Description	Remedial Technology	Process Option and Description	Effectiveness	Difficulty and Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
						Tidal Flats	OF-008 Drainage Ditch	
<p>REMOVAL</p> <p>Physical excavation and disposal on- or off-site of contaminated material.</p> <p>Typical controls may be required for all removal technologies to reduce impacts on water quality, marine plants, and species. Controls may include various types of resuspension controls and fish exclusion barriers.</p>	Mechanical Dredging	Stationary dredgers that mechanically remove sediment from areas of concern. Equipment available with a variety of different dredging heads. Removed material is placed onto the back of the barge or an adjacent barge.	Variable Effectiveness. Effectively reduces the volume of contaminated sediment with precise GPS assisted removal. Overall effectiveness will be determined by contaminant delineation and removal.	Moderate-High Difficulty. May require construction of access roads, staging areas, and offloading facilities for dredged sediment. Requires engineering controls to prevent resuspension. Requires engineering controls to reduce impacts of suspended sediments as well as water treatment or disposal of dredge water.	High	Yes	No	Good technology for most sediment types and Sites with sediments that may generate sheen when agitated. Generally a slower removal method than hydraulic.
	Debris and Large Material Removal	Prior to dredging, sediments are sifted to remove debris and large objects from the dredge prism. This step allows material to be hydraulically dredged and turned into a slurry for hydraulic pumping through a pipeline of designed length to landside processing areas	Limited Effectiveness. Allows for areas with debris or other factors limiting hydraulic dredging to be hydraulically processed.	Moderate-High Difficulty. Requires additional equipment to be staged and assembled to allow for material screening. Operation would likely be in place and used in combination with hydraulic dredging or mechanical dredging with hydraulic transfer.	Moderate	Yes	No	May require pilot tests to determine site-specific and setting-specific effectiveness. Applicable to Tidal Flats; however, debris is not a major concern.
	Hydraulic Dredging	Stationary dredger that hydraulically remove sediment from areas of concern by means of loosening and disintegrating the bottom material into particle sizes compatible with a high velocity suction intake. The removed sediment is transported as a slurry through a pile line of designed length to the deposit area. The deposit area may be a barge, Geotube, or a confined disposal facility	Variable Effectiveness. Effectively reduces the volume of contaminated sediment. Overall effectiveness will be determined by contaminant delineation and removal.	Moderate-High Difficulty. May require construction of access roads, staging areas, pipelines, and offloading facilities for dredged sediment. Requires engineering controls to reduce impacts of suspended sediments as well as water treatment or disposal of dredge water.	High	Yes	No	Hydraulic dredging may be difficult in sensitive environments at Sites with sediments that may generate sheen when agitated. Good for fine loose sediments with a high water content. Difficult technology to be used in areas with debris and hard sediments or clays. Generally a faster removal technology than mechanical but requires a larger processing area for dewatering.
	Mechanical Excavation in the Dry	Traditional excavation of sediment "in the dry," relying on other technologies (or at low tide only) to allow this technique. Standard reach or long-reach excavation equipment can be staged along shoreline, or placed within dewatered area with or without access roads to remove sediments for placement into trucks for hauling to the site.	Variable. Allows more controlled removal with increased visibility of sediment and operations at opposite ends of the tidal cycle. Reduces water treatment and sediment processing required. Softness of sediment makes placing standard equipment on Tidal Flats ineffective.	Moderate-High Difficulty. Excavation equipment is well-established and available. Must be carefully coordinated with tidal cycles, dewatering efforts. Logistics can be challenging; therefore, experienced contractors are needed to implement in areas requiring significant water control challenges. More difficult in deep water, tidal, high current conditions, or soft sediment situations.	Moderate-High	Yes (perimeter only)	Yes	Tidal Flats have vast open area and sediments are soft, making excavation in this manner impractical. Applicable to perimeter of Tidal Flats with long-reach excavator OF-008 easier to isolate and dewater at the mouth of the drainage ditch and at OF-008. Standard excavation is feasible.

**Table 3-2
Initial Technology Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action and Description	Remedial Technology	Process Option and Description	Effectiveness	Difficulty and Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
						Tidal Flats	OF-008 Drainage Ditch	
	Amphibious Dredge	Dredging equipment designed to handle a wide variety of site conditions. Units can include both mechanical excavation and hydraulic excavation tooling, and can operate as floating plant or on sediment surface. "Swamp buggy" equipment is traditional excavation equipment with very large tracks with very low ground pressures and can even float. Amphibex manufactures dredges that can operate in hydraulic or mechanical mode.	Variable Effectiveness. Ideal for tidal cycle fluctuation work. Works in a variety of environments. May cause excessive turbidity generated due to disturbance of sediment surface by equipment operation.	High Difficulty. Potential concerns with Jones Act compliance (Amphibex); however, equipment with U.S. constructed hulls can be provided but may have long lead time. Marsh buggy equipment generally available.	High	Yes	No	Potential applicability to Tidal Flats given its ability to work around the tidal cycle.
	Temporary Dams	Temporary dam technologies to support mechanical dredging or traditional excavation "in the dry" include: Aqua-Barrier: Portable, water-inflated temporary dam designed for dewatering the dammed area to support dry excavation within waterways. Porta dam: Constructed of steel supports and poly-tarping Porta dam creates a temporary diversion for water to support dry excavation within waterways. Sheet Piling: Steel or plastic sheet piling is used to create a physical barrier around the desired construction area designed to limit waters from entering and/or for dewatering the dammed area to support dry excavation within waterways. Muscle Wall: Light weight barriers constructed of low density polyethylene are used to support containment. Earthen Berms: Barriers constructed of impermeable or semi-impermeable soil materials to create an embankment allowing control of water levels.	Variable Effectiveness. Allows for excavation "in the dry" improving the ability to more accurately remove sediments with less over dredge. Can increase work hours available. Reduces water treatment and sediment processing requirements. These systems, with the exception of sheet piling may have limited effectiveness given water depths at high tides.	Moderate-High Difficulty. Can be implemented in combination with excavation and removal technologies to isolate saturated soils. More difficult in deep water, tidal or high current conditions. Challenging to implement adjacent to existing breakwater.	Moderate-High	Yes (only sheet pile)	Yes	Tidal Flats have vast open area and difficult to fully dewater and isolate from the river. Sheet pile only retained for Tidal Flats Various technologies have applicability for OF-008, for cut off of mouth of the drainage ditch, excavation cell isolation, inlet control, and adjacent runway ditch control.

**Table 3-2
Initial Technology Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action and Description	Remedial Technology	Process Option and Description	Effectiveness	Difficulty and Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
						Tidal Flats	OF-008 Drainage Ditch	
	Other Engineering Controls (Turbidity Control/ Fish Barriers)	<p>Barriers (silt curtains and sheet pile cofferdams) to prevent or reduce the migration of re-suspended sediment that can cause exceedance of turbidity monitoring requirements.</p> <p>Fish barriers prevent species of concern from entering work area.</p>	<p>Variable Effectiveness. Turbidity barriers must be selected and installed carefully to be fully effective given waterway and sediment characteristics (water depth, current, tidal cycle, sediment fines).</p> <p>A sheet pile cofferdam would eliminate migration of resuspended sediments. Proper design would ensure complete enclosure of area. Sheet pile cofferdam would allow for the possibility of 24/7, 365 days per year operation.</p> <p>Fish barriers are effective if properly sized, engineered for strength, and anchored.</p>	<p>Variable Difficulty. Silt curtains are easily installed and maintained (requires knowledgeable contractors) and require straightforward design.</p> <p>A sheet pile cofferdam requires significant engineering, coordination with agencies, and requires specialty marine contractors to install. May add significant time to schedule before dredging can begin. Significant challenges installing near existing breakwater. Relatively easily to install fish barriers, but must be maintained. Fish within Outfall 008 drainage ditch may need to be "relocated" prior to dewatering.</p>	Low-Very High	Yes	No	<p>Both turbidity barrier methods and fish barriers are applicable to Tidal Flats work.</p> <p>Not applicable to Outfall 008 if work done "in the dry."</p>
<p>MATERIAL TRANSPORT</p> <p>Required to move the removed sediment from the water to land for processing and disposal.</p>	Barge/Scow	Material is loaded to a barge or scow by hydraulic or mechanical methods. The barge or scow is maneuvered using tug and/or push boats to the deposit area. Requires landside bulkhead, pier or wharf for barge docking and off-loading.	<p>Effective. Very effective in areas with space and adequate draft. Coupled with tug/push boats, has potential to generate resuspended sediments due to propulsion and draft.</p>	<p>Moderate Difficulty. Can be implemented with various removal technologies to transfer removed sediments. Barge/scow limited by water depth and landside access.</p>	Moderate-High	Yes	No	<p>Universal transportation method for mechanical dredge projects. Geotubes may be placed inside barges/scows in combination with a barge based water treatment system for hydraulic dredging.</p>
	Pneumatic Flow Tube Mixing (PFTM)	Dredged materials are placed into a hopper barge, then run through a metered pugmill which feeds material into a pipeline which is then conveyed in "slugs" via pneumatic pumping. Stabilization agents (e.g. Portland Cement) are mixed in-line to create a material which, when discharged, can be beneficially reused as a soil-like product.	<p>Effective. Effective with evenly graded sediments and adequate upland space for discharge/disposal.</p>	<p>Moderate-High Difficulty. Pipelines can be assembled at various lengths and can be floated on the surface of the water or be run over land to the deposit area. Requires specialized pump equipment and maintenance.</p>	High	Yes	No	<p>PTFM can be very effective at moving dredged sediment and eliminating the need for dewatering and processing.</p>

**Table 3-2
Initial Technology Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action and Description	Remedial Technology	Process Option and Description	Effectiveness	Difficulty and Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
						Tidal Flats	OF-008 Drainage Ditch	
	Hydraulic	Material is transported as a slurry from the dredge area through a pipe line of designed length to the deposit area. Requires slurry to have low percent solids for pumping.	Effective. Very effective at moving slurries of sediment less than ½ inch in diameter and free of debris.	Moderate-High Difficulty. Pipelines can be assembled at various lengths and can be floated on the surface of the water or be run over land to the deposit area. Will require additional material processing if dredging mechanically to make the dredged material into a slurry. May require extensive water treatment.	High	Yes	No	Universal transportation method for hydraulic dredge projects. Can be coupled with mechanical dredging by placement of dredged sediments in a slurry box, and transforming into a slurry and conveyed to land.
	Trucks	Material is mechanically loaded to trucks and driven to deposit area. Requires sediment to have relatively low water content.	Variable Effectiveness. Effective in areas close to land not requiring trucks to enter public roadways unless the material is free of liquids.	Variable Difficulty. Limited capacity per truck requiring multiple trucks. Not suitable for hydraulic removal methods. Most areas of the site are not adjacent to land eliminating this technology. In areas where trucks can be accessed by mechanical equipment, this technology may be acceptable.	Moderate-High	Yes	Yes	Potentially useful if performing mechanical excavation in the dry using excavation support and in intertidal areas with longer periods of exposure if mechanically removing in the dry during tidal cycles.
MATERIAL DEWATERING AND PROCESSING	Gravity Dewatering	Dewatering method where sediment is transported to land and placed in a sediment dewatering area to allow water to be removed through evaporation, and gravity draining with collection and treatment.	Limited Effectiveness. Highly effective and relatively quick for coarse grained material. Fine or well graded materials may retain water for longer periods of time reducing effectiveness and requiring additional space for large operations.	Easy-Moderate Difficulty. Requires staging areas and space. Dewatering time will vary depending on material properties.	Low	Yes	Yes	Simple to implement. May require additional tests to determine site-specific and setting-specific effectiveness.
	Material Screening and Size Separation	Slurried sediment is passed through a series of screens, augers, etc. to separate coarse material and debris from the fine material to allow for mechanical dewatering of the dredge slurry.	Limited Effectiveness. Pilot-testing is likely required. Allows for slurry to be mechanically dewatered.	Moderate-High Difficulty. Requires additional equipment to be staged and assembled to allow for material screening prior to mechanical dewatering. Equipment can become bridged or jammed and requires maintenance. Operation would be used in combination with hydraulic transfer.	Moderate	Yes	No	May require pilot tests to determine site-specific and setting-specific effectiveness.

Initial Technology Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action and Description	Remedial Technology	Process Option and Description	Effectiveness	Difficulty and Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
						Tidal Flats	OF-008 Drainage Ditch	
	Belt Press	Continuous dewatering devices that rely on confining (squeezing) the sediment in between two polymer mesh tensioned belts, allowing the pressate to seep through the fabric. The belt press can produce dewatered materials at 35-55% solids at 125 psi operating pressure with properly conditioned incoming slurry.	Effective. Requires material to be hydraulically dredged or hydraulically transferred. Requires desanding and processing of dredged slurry prior to dewatering.	Moderate Difficulty. Can be implemented with various removal technologies. May require extensive water treatment. May require use of polymers to enhance filtration.	Moderate-High	Yes	No	Can be used with for all dredging technologies, however, additional processing is required to hydraulically slurry mechanically dredged sediment. Can required a large space for laydown and be a slow process.
	Recessed Chamber Filter Press	Dewatering devices that rely on confining the slurry within a series of steel or rigid composite plates with the filter media stretched across the plate frame. The sediment particulate coats the media and the filtrate passes into the plate and is drained through channels in the press. As a result of the rigid frame, the press can operate at higher pressures (up to 225 psi), which produces dewatered sediments in excess of 60% solids.	Effective. Requires material to be hydraulically dredged or hydraulically transferred. Requires desanding and processing of dredged slurry prior to dewatering.	Moderate Difficulty. Can be implemented with various removal technologies. May require extensive water treatment. May require use of polymers to enhance filtration.	Moderate-High	Yes	Yes	Can be used with for all dredging technologies, however, additional processing is required to hydraulically slurry mechanically dredged sediment. Can required a large space for laydown and be a slow process.
	Centrifuge	Slurry is spun at high rpms to separate solids from water	Effective. Uses centrifugal forces to separate particles from water.	Moderate-High Difficulty. Complex machines that can be difficult to operate. May require use of polymers to enhance separation.	High	Yes	No	Included for evaluation in treatability studies
	Proprietary Mechanical Dewatering Systems	Commercially available complete dewatering systems for sediment, including Genesis Rapid Dewatering System, Hi-G screening, and TCW 3000 Plus.	Effective. Used in other industries and adapted to sediments dewatering. Combines various technologies into complete system.	Moderate-High Difficulty. Dewatering is complex and use of these proprietary systems depends on contractor familiarity. May require use of polymers to enhance filtration.	High	Yes	No	Retained Hi-G screening as representative technology only.
	Geotubes	Continuous dewatering device that relies on pumping of the dredged slurry into large tubes (up to 200 feet long, up to 60 feet in circumference) of woven geotextile fabric. The fabric retains the sediment particles allowing the filtrate to pass and the sediment is concentrated within the tube to a solids level of ~25-50% based on the sediment using the pressure of the slurry pump (generally 60 psi or less).	Effective. Sediment is retained and dewatered at the same time. Requires material to be hydraulically dredged or hydraulically transferred. Does not require size separation – can handle sand and larger sized particles.	Moderate Difficulty. Can be implemented with various removal technologies. May require extensive water treatment. Can require large areas to stage tubes for long periods of time (45 days or more). May require use of polymers to enhance filtration.	Moderate-High	Yes	No	Can be used with for all dredging technologies, however, additional processing is required to hydraulically slurry mechanically dredged sediment. Useful as erosion protection barriers and to build land in used in combination with a CDF. To be evaluated in treatability studies.
	Solidification and Stabilization	Mixing of reagents with dredged material to reduce water content,	Effective.	Moderate Difficulty.	Moderate-High	Yes	Yes	May require pilot tests to determine the most

**Table 3-2
Initial Technology Screening

						Tidal Flats	OF-008 Drainage Ditch	
		increase strength, fix contaminants, and solidify sediment. Reagents may include Portland cement, lime, Calciment, etc. Requires landside area for sediment processing or barge mounted equipment to for processing on the water.	Sediment treatability studies would be required to determine site-specific and setting-specific effectiveness of the various reagents available.	Once material is dredged it is then treated ex-situ in preparation for disposal or re-use on-site. Requires landside access for barge docking and processing.				effective reagents, and specialized equipment for the solidification/ stabilization process. To be evaluated in treatability studies.
	Wastewater Treatment Technologies	Multiple Process Options Multiple process options are available for treatment of wastewater from ex situ operations. Options include pH adjustment, flocculants, settling, clarification, carbon adsorption, ion exchange, reverse osmosis, and specialty media treatment.	Effective. Multiple process options that are proven technologies are available to treat waste water prior to discharge. Bench-scale and/or pilot-scale studies would be required to determine which process options would be required to meet permitted discharge criteria.	Variable Difficulty. Permit discharge requirements will determine the treatment processes necessary prior to discharge. Systems can be land-based or barge-based and may be discharged to sewers or back to the remediation area waters.	Low-High	Yes	Yes	Required for any de-watering process. Bench-scale and/or pilot-scale studies would be required to determine site-specific and setting-specific effectiveness. To be evaluated in treatability studies.
DISPOSAL/RE-USE Disposal of excavated material at a permitted landfill or appropriate re-use on-or off-site following implementation of removal options identified above.	Confined Disposal Facility (CDF)	Upland areas and near shore areas that are diked to contain dredged material and allow clear water to return to the waterbody.	Effective. CDFs are a proven technology to contain sediment.	Moderate-High Difficulty. Requires available area for disposal. Areas will eventually create a land mass that will require a cap or institutional controls to prevent entry. Approval/permitting may be difficult.	Moderate-High	Yes	Yes	Can be used with for all dredging technologies. Material can be hydraulically slurried or mechanically placed. Eliminates the need for dewatering. Design, siting, and regulatory approvals would be required to determine site-specific and setting-specific viability. Agencies have indicated initial interest in shoreline CDF. Placement along shoreline to be evaluated further.
	Confined Aquatic Disposal (CAD) Cell	Construct an approved CAD cell. An approved underwater area is excavated to allow the placement of contaminated sediment within the area. Once full, the CAD cell is capped with material to prevent diffusion of contaminants.	Effective. Aquatic disposal cells are a proven technology to contain contaminated sediment.	High Difficulty. Requires available area for disposal and rigorous design and construction to place and contain buried sediment. Approval/permitting may be difficult and require long-lead time with coordination with multiple agencies and jurisdictions.	High	Yes	No	Can be used for mechanical dredging and potentially hydraulic dredging with additional processing prior to placement. Design, siting, and regulatory approvals would be required to determine site-specific and setting-specific viability. Not viable.
	Beneficial Reuse	Removed material that meets off or on-site beneficial reuse limitations (both chemical and physical) can be	Effective. An effective use of treated sediment.	Low Difficulty. Would likely require physical conditioning in the form of dewatering	Low-Moderate	Yes	Yes	Will require additional testing and precharacterization.

**Table 3-2
Initial Technology Screening
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

General Response Action and Description	Remedial Technology	Process Option and Description	Effectiveness	Difficulty and Implementability	Cost	Retained for Further Evaluation		Screening Rationale and Comment
						Tidal Flats	OF-008 Drainage Ditch	
		transported to pre-approved locations for re-use rather than disposal or placed and managed on-site as future fill material to be used in future development. Examples include landfill cover, roadway base, and on-site fill.		and drying and addition of amendments such as lime or Portland cement to meet physical acceptance criteria. Presence of significant organic matter (i.e., wood waste), which is not expected, may not be acceptable.				
	Off-Site Disposal	Dredged material would be dewatered and transported off-site to an approved landfill. Material assumed to be appropriate for disposal as RCRA subtitle D.	Effective. A permitted landfill is a technology proven to contain waste. Conditioning of sediments (e.g., dewatering, drying, and amendments such as Portland cement or lime) to meet landfill's physical acceptance criteria would likely be required.	Low Difficulty. Landfilling dredged material is a common practice. Waste characterization sampling would be required prior to disposal. Would require access roads for trucks, but these would likely already be in place from removal activities.	High	Yes	Yes	Will require additional testing and precharacterization.
HABITAT RESTORATION Activities completed to mitigate short-term impacts of remedial actions to local habitat and reestablish physical and biological functions of the waterways.	Bank Treatments/Bioengineering	Bank Treatments/Bioengineering use coir fabrics, coir logs, and native vegetation to reduce erosion, improve water quality and improve habitat. Intended to maintain stable channel.	Effective. This is a proven, documented restoration strategy.	Low-Moderate Difficulty. Could be as simple as planting vegetation, or as complicated as re-grading banks and constructing engineered banks including coir fabric and logs.	Low	No	Yes	May be applicable depending on final restoration plan.
	Riparian Vegetation	Establish buffer of trees, shrubs, forbes, grasses and sedges depending on the ecological zone. May include invasive species management.	Effective. This is a proven, documented restoration strategy implemented by qualified, experienced personnel.	Low Difficulty. Planting appropriate vegetation to maintain or repair the riparian zone as part of remediation. Requires maintenance.	Low	No	Yes	May be applicable depending on final restoration plan.
	Tidal Salt Marsh	Re-plant tidal salt marsh grasses. May include invasive species management.	Effective. This is a proven, documented restoration strategy if implemented by qualified, experienced personnel.	Low-Moderate Difficulty. Planting appropriate vegetation to maintain or repair the tidal salt marsh as part of remediation. Requires maintenance.	Low	Yes	Yes	May be applicable depending on final restoration plan.
	Tidal Mudflats/Backfilling	Replaced removed material with properly sized material depending on the ecological zone and the physical forces.	Effective. This is a proven, documented restoration strategy.	Low Difficulty. Installing properly sized material in the tidal mudflat zone as part of remediation easily implemented.	Low	Yes	Yes	Applicable to all Tidal Flats area and the Outfall 008 drainage ditch.

Alternative 1 (No Action) No Further Action	Low (1) <ul style="list-style-type: none"> Will not achieve remedial goals for the site, risks will remain on-site 	High (3) <ul style="list-style-type: none"> Low technical complexity due to ongoing monitoring plan 	Low (3) <ul style="list-style-type: none"> continued maintenance and monitoring plan 	Not Retained (7) Remediation required
Alternative 2 (Mechanical Excavation) <ul style="list-style-type: none"> Isolate and dewater area for mechanical excavation using land based excavator Truck transport to processing area Process and dewater with Portland cement Import clean material for mechanically placed backfill and restoration On-site beneficial reuse of non-TSCA sediments (<1 ppm PCBs) and off-site disposal of TSCA sediments (1 ppm ≤ PCBs < 50 ppm and ≥ 50 ppm) or off-site disposal of all sediments; Water treatment and discharge back to Housatonic River 	High (3) <ul style="list-style-type: none"> Will achieve the remedial goals with impacts removed by dredging and isolated by capping Significant quantity of impacted sediment which poses a risk to be reused on-site or disposed of off-site Isolation and dewatering of the drainage ditch will contain sediments and minimize turbidity migration Restoration more effective under dewatered scenario 	Moderate (2) <ul style="list-style-type: none"> Moderate technical complexity due tide fluctuations, interconnection with adjacent ditch, and existing bathymetry Greater need for temporary infrastructure for roadways and processing of sediments Readily available services, materials, equipment and specialists locally On-Site area available for processing, treatment, and handling facilities Will meet substantive requirements of multiple permits needed for implementation 	Moderate-High (1.5) <ul style="list-style-type: none"> Moderate relative cost, significant costs to control water 	Retained (6.5) <ul style="list-style-type: none"> Standard industry accepted dredging technologies Readily available technology Low impact dredging with few roads/infrastructure needs Low relative costs with high production rates
Alternative 3 (Mechanical Dredging) <ul style="list-style-type: none"> Mechanical dredge to mechanical off-load, Turbidity barrier to control migration of resuspended sediments; Gravity drainage followed by solidification; Mechanically placed backfill; On-site beneficial reuse of non-TSCA sediments (<1 ppm PCBs) and off-site disposal of TSCA sediments (1 ppm ≤ PCBs < 50 ppm and ≥ 50 ppm) or off-site disposal of all sediments; Land-based Long-stick excavation of near shore sediments; Water treatment and discharge back to Housatonic River 	Low-Moderate(1.5) <ul style="list-style-type: none"> Will achieve the remedial goals with impacts removed by dredging and isolated by capping Significant quantity of impacted sediment which poses a risk to be reused on-site or disposed of off-site Possible release of resuspended sediments into adjacent airport ditch and marine basin - turbidity curtains needed minimize migration of residuals Several seasons required to complete due to aquatic species restrictions Restoration difficult/less effective for high water conditions 	Low (1) <ul style="list-style-type: none"> High technical complexity due to narrow footprint of the drainage channel for sediment dredging and capping, tide fluctuations, and existing bathymetry Greater need for temporary infrastructure for crane platform, dock, trucking, staging. Readily available services, materials, equipment and specialists locally On-Site area available for processing and treatment facilities Will meet substantive requirements of multiple permits needed for implementation 	Moderate (2) <ul style="list-style-type: none"> Low relative costs, little to no costs related to control of water 	Not Retained (4.5) <ul style="list-style-type: none"> Not an effective solution for the size of the drainage ditch to be dredged. Tidal fluctuations and site logistics would hinder production rates making it an impractical alternative

Notes:

¹ Costs are assessed in a relative sense. Quantitative costs are developed for the retained alternatives in Section 5 and will be equivalent to “engineer’s estimates” within minus 30% and plus 50% of actual quantities consistent with USEPA feasibility study guidance.

² Ranking evaluations based on High (3), Moderate (2) and Low (1).

³ Ranking for Cost are reversed to reflect accurate ranking (i.e., high cost was given a low ranking).

⁴ Other dewatering systems may be viable, equally effective, and have lower costs; however, it is beyond the scope of this FFS to evaluate all systems available.

Notes:

- Costs are engineer's estimates and are anticipated to be within minus 30% and plus 50% of actual quantities consistent with USEPA feasibility study guidance.
- "On-Site beneficial reuse" cost includes off-site disposal costs for TSCA material (>= 50 mg/kg PCBs) and RCRA-D material (>=1 and < 50 mg/kg PCBs) and on-site processing and placement of sediments containing <1.0 mg/kg PCBs and otherwise meeting CT residential soil criteria.
- See Table 6-3 and Appendix E for additional cost information. Off-site disposal assumes all materials will be disposed of off-site.

**Table 5-1
Criteria Evaluation
Stratford Army Engine Plant Feasibility Study
Stratford, Connecticut**

4. Cost differences between on- and off-site options for Alternatives that have both options are driven by two main factors: 1. For options including hydraulic dredging (Alternative 2), the overdredge is larger than for options that include mechanical dredging, which requires the processing and disposal of a larger quantity of sediment; and 2. For options utilizing geotubes or belt press dewatering (Alternative 2 and 4), no Portland cement is included while for options that utilize mechanical dredging the addition of 6% Portland cement adds to the cost (Alternatives 3, 5, and 6).

Notes:

1. Costs are engineer's estimates and are anticipated to be within minus 30% and plus 50% of actual quantities consistent with USEPA feasibility study guidance.
2. Season assumes a work window is July 1 through January 31. See Table 6-2 for a Detailed Schedule Comparison.
3. On-Site beneficial reuse cost includes off-site disposal costs for TSCA material.
4. See Table 6-3 and Appendix E for additional cost information.
5. NA – Not Applicable
6. Cost differences between on- and off-site options for Alternatives that have both options are driven by two main factors: 1. For options including hydraulic dredging (Alternative 2), the overdredge is larger than for options that include mechanical dredging, which requires the processing and disposal of a larger quantity of sediment; and 2. For options utilizing geotubes or belt press dewatering (Alternative 2 and 4), no Portland cement is included while for options that utilize mechanical dredging the addition of 6% Portland cement adds to the cost (Alternatives 3, 5, and 6).

Notes:

1. Ranking is for the Alternatives which incorporate both the Tidal Flat and OF-008 Remediation Area
2. Costs are engineer's estimates and are anticipated to be within minus 30% and plus 50% of actual quantities consistent with USEPA feasibility study guidance. High Cost = Low Rank, Lower Costs = High Rank
3. Costs presented are total escalated capital costs to year 2022. See Table 6-3 and Appendix E for additional information.
4. The development of scores for alternatives is by its nature highly subjective; however, it provides a useful framework for categorizing and organizing the performance of various alternatives with respect to the evaluation criteria. Using the 0 to 4 point scale for each criterion, total scores within one point of each other can be considered essentially the same due to the subjective nature of this evaluation. The score itself is not the final decision factor in selecting a remedy. Rather, it helps to identify the major advantages and disadvantages among the alternatives to be discussed as part of the preferred remedy.

Low (0 points)
 Low to Moderate (1 point)
 Moderate (2 points)
 Moderate to High (3 points)
 High (4 points)

1.0 INTRODUCTION

This report presents the results of 2014-2015 sediment chemical characterization, proposed sediment remediation endpoints, and preliminary remediation footprints for the areas known as the Tidal Flats and Outfall 008 at the Stratford Army Engine Plant (SAEP) in Stratford, Connecticut. The location of the SAEP is presented in **Figure 1-1**. The sediment areas of interest are presented in **Figure 1-2**.

1.1 Description of Sediment Areas

The locations of the Background/Reference, the Tidal Flats, and Outfall 008 sediments areas are shown on **Figure 1-2**.

Tidal Flats

The Tidal Flats are classified as estuarine and marine wetlands. The Tidal Flats consist of fine-grained sediments exposed twice daily during low tide. These sediments are mostly un-vegetated, with the northwest portion supporting limited emergent vegetation. A Causeway extends from the upland to the river channel and divides the Tidal Flats into two areas. The Causeway was constructed over the Tidal Flats in 1929 to provide access to the river channel. A stone jetty in the northern portion of the Tidal Flats extends to the river channel and was built in 1932 to divert effluent from the Stratford Water Pollution Control Facility, which is located immediately upstream from the Tidal Flats. Numerous outfalls formerly released liquid waste streams from SAEP industrial operations to the Tidal Flats.

Outfall 008

The Outfall 008 drainage ditch is located at the southern boundary of the site, and was used to discharge treated wastewater associated with metal plating into a drainage ditch that flows to the south. The drainage ditch originates at Outfall 008. It is approximately 10 to 12 feet wide and generally less than 2 feet deep. From Outfall 008 the ditch extends south-southeast a distance of 1,000 feet to a partially collapsed steel culvert which runs underneath a dirt road. The partial collapse of the steel culvert currently limits the tidal fluctuation impacts in the portion of the ditch between the culvert and Outfall 008. From the dirt road, the ditch extends another 110 feet south-southeast, where it intersects a perpendicular ditch. This perpendicular ditch carries runoff from the airport (located to the southwest, across Main Street) to Marine Basin (located 250 feet east of the junction of the Outfall 008 Drainage Ditch and the perpendicular ditch). Water in the perpendicular drainage ditch flows to Marine Basin, which in turn drains to the Housatonic River.

As part of the Connecticut Department of Transportation (CT DOT) Runway Safety Area Project (Re-alignment of CT Route 113, CT DOT Project 15-336), in 2013 parts of the Outfall 008 drainage ditch and a portion of the property adjacent to the ditch were evaluated for the presence of Raymark waste. The investigation determined that Raymark Waste is present adjacent to the Outfall 008 drainage ditch, making it difficult to discern which proportion of metals are attributable to the SAEP facility, and which are attributable to the Raymark waste. **Figure 1-3** presents the

extent of Raymark waste as depicted in the Removal Work Plan for the Raymark Waste (URS Corporation AES, 2014). The Removal Work Plan identifies Raymark wastes at depths up to 8 feet in areas adjacent to the drainage ditch, and states that “RMW (Raymark Waste) extends into the tidal channel”. The delineation of Raymark Waste was not completed along the drainage channel to the north, toward Outfall 008. Review of historical aerial photographs indicates that this area was also filled sometime between 1951 and 1965, and given the presence of Raymark Waste in the fill areas that were investigated, it is possible that the areas to the north that were not investigated also contain Raymark Waste. The excavation of Raymark Waste was conducted in 2015, slightly altering the portion of the Outfall 008 drainage ditch adjacent to the former Raymark Waste.

Background/Reference Area

The Background/Reference Area is located across the Housatonic River from SAEP, in and around the marshy land mass known as Nell’s Island (see **Figure 1-2**). The location of the Background/Reference area has been mutually agreed upon by the Army and CT DEEP, as other potential background/reference areas further upstream in the Housatonic River lacked the finer grained materials present in the Tidal Flats and Outfall 008 sediments.

1.2 Background Information

There have been numerous investigations of the sediments in the Tidal Flats and Outfall 008 areas prior to 2014, and are summarized as follows:

- Sampling of the Tidal Flats and Outfall 008 drainage ditch sediments was conducted by the U.S. Army in 1992, 1994, and 1999 as part of a Remedial Investigation.
- The Connecticut Department of Transportation (CTDOT) also conducted sediment investigations in the Outfall 008 drainage ditch in August 2012.
- Background/reference sediment sampling was conducted in 1994, 1999, 2009, and 2012.

In April 2014, the U.S. Department of the Army issued the Final Work Plan for Determination of Sediment Remediation Endpoints, Tidal Flats and Outfall 008, Stratford Army Engine Plant, Stratford, Connecticut (AMEC, 2014a). This work plan was reviewed by the Connecticut Department of Energy and Environmental Protection (CT DEEP). The Work Plan proposed sediment toxicity testing to assist in developing the remediation endpoint goals for the sediments in question, and laid out the steps for development of the remediation endpoints. The Final Work Plan also presented some of the historical sediment data referenced above. In April and May 2014, additional sediment sampling and toxicity testing were conducted, and in September 2014 the Army issued the Draft Sediment Remediation Endpoints Report for the Tidal Flats and Outfall 008 (AMEC, 2014b). The report presented the results of sediment chemical characterization, toxicity testing results, and proposed sediment remediation endpoints for the Tidal Flats and Outfall 008 areas. The results of the toxicity testing were that toxicity is not definitively linked with a specific chemical present in the sediment. As an alternative to using toxicity test results alone for development of remediation endpoints, the report presented statistical analyses of the data

and proposed using an Effects Range Medium Quotient (ERM-Q) of 1.0 for the metals cadmium, chromium, and copper.

On December 2, 2014, the CT DEEP submitted comments on the Draft Sediment Remediation Endpoints Report (AMEC, 2014b). CT DEEP concluded from their review of the report that toxicity is not definitively linked with a specific chemical, and recommended setting the remedial goal based on multiple chemicals to more accurately describe the chemical quality associated with the non-toxic samples. CT DEEP's recommendations for determining the sediment remediation endpoint goals were as follows:

- Use an average ERM-Q of 0.5 for the eight metals arsenic, cadmium, chromium, copper, lead, nickel, silver, and zinc; an average ERM-Q > 0.5 would require remediation
- Concentrations of mercury and PCBs should generally not be present in post-remedial conditions
- Additional site characterization was needed to refine the area of sediment contamination both at depth within the Tidal Flat and Outfall 008 areas, as well as within surficial and deeper sediments between the eastern edge of the intertidal flats and the Housatonic River.

On February 17, 2015, the U.S. Department of the Army responded to CT DEEP's comments indicating that they agreed to removal of contaminated sediments with average ERM-Qs > 0.5 from the 0-2 foot below ground surface (bgs) interval in both the Tidal Flats and Outfall 008 areas, as well as replacement with CT DEEP-approved backfill.

Following further discussions with CT DEEP, the U.S. Department of the Army issued a memorandum to CT DEEP on March 24, 2015 indicating that they were committed to proceeding with the additional sampling in a timely manner to ensure redevelopment of the SAEP site without further delay.

In April 2015, additional sediment sampling was conducted in the Tidal Flats and Outfall 008 areas, as follows:

- between the Tidal Flats and the margin of the dredged Housatonic River channel,
- at depths greater than 2 feet bgs in the Tidal Flats, and
- at depths greater than 2 feet bgs in the Outfall 008 drainage ditch.

In November 2015, Amec Foster Wheeler was placed under contract to analyze the sediment samples collected in April 2015, and to incorporate the analytical results into a revised version of the Sediment Remediation Endpoints Report. The revised Sediment Remediation Endpoints Report was issued to the Army on July 29, 2016, and to the CT DEEP on March 7, 2017.

On May 17, 2017, the Army received comments from the CT DEEP on the Sediment Remediation Endpoints Report. These comments, and responses from the Army, are included as Appendix F.

Sediment Remediation Endpoints Report
Tidal Flats and Outfall 008
Stratford Army Engine Plant, Stratford, Connecticut

This report presents the sediment data collected in 2014 and 2015 from the Background/Reference Area, the Tidal Flats, and Outfall 008 areas, develops average ERM-Qs for the eight metals, compares the calculated average ERM-Qs for eight metals to a remedial target of 0.5, and evaluates the contamination from total PCBs and mercury, which CT DEEP has requested should generally not be present in post-remediation sediments at concentrations greater than background. Proposed remedial footprints (by depth interval) are also presented. This document is intended to be used in development of a Feasibility Study for removal of the contaminated sediments. Amec Foster Wheeler is currently under contract with the U.S. Army Corps of Engineers – New England District (CENAE) to perform the Feasibility Study.

2.0 SAMPLING, ANALYSIS, AND VALIDATION

Sediment sampling activities were conducted in 2014 and 2015 in the Background/Reference Area (2014 only), the Tidal Flats, and Outfall 008 Drainage Ditch. Sampling activities were conducted in accordance with the Final Work Plan: Determination of Sediment Remediation Endpoints, Tidal Flats and Outfall 008, Stratford Army Engine Plant, Stratford, Connecticut (AMEC, 2014a), except where otherwise noted. The following subsections detail the locations, quantities, and analyses for the program.

2.1 Sediment Sampling and Analysis Overview

2014 actual and 2015 proposed sediment sample locations for the Background/Reference Area, Tidal Flats, and Outfall 008 areas are presented in **Figures 2-1** through **2-3**, respectively. A summary of laboratory analyses performed on each of the samples is provided in **Table 2-1**. Field data records for collection of sediment samples are provided in **Appendix A**.

2.1.1 2014 Sediment Samples

2014 sediment samples were collected for chemical analysis from 110 locations, as follows:

- 24 samples from 24 locations from the Background/Reference Area (Nell's Island).
- 134 samples from 67 locations in the Tidal Flats, and
- 38 samples from 19 locations in the Outfall 008 area.

In late April 2014, sediment samples were collected from the 0-0.5 and the 1-2 foot bgs depth intervals using hand coring techniques. For the 0-0.5-foot depth interval samples, an aliquot of each was analyzed for SVOCs, metals (antimony, arsenic, cadmium, chromium (total), copper, lead, manganese, mercury, nickel, selenium, silver, thallium, and zinc), cyanide (total), PCB homologs, PCB Aroclors, asbestos (chrysotile only), and TOC. A subset of these samples was analyzed for grain size (see **Table 2-1**). Sediment samples collected for chemical analyses were submitted to York Analytical Laboratory, a CT DEEP-approved analytical laboratory located in Stratford, Connecticut.

Sediment samples were also collected from the 1-2 foot depth interval at each sampling location in the Tidal Flats and Outfall 008 areas, submitted to York Analytical Laboratory, and frozen pending results of the 0-0.5 foot bgs depth interval samples. Following preliminary assessment of the 0-0.5 foot depth interval sediment chemistry, it was determined that the 1-2 foot bgs depth interval samples be thawed and analyzed for metals (antimony, arsenic, cadmium, chromium (total), copper, lead, manganese, nickel, selenium, silver, thallium, and zinc), SVOCs, PCB homologs, PCB Aroclors, and TOC. Sediment samples from the 1-2 foot depth interval were frozen upon receipt at the laboratory in late April 2014, and thawed, processed, and analyzed in August 2014. Mercury was not analyzed for in the 1-2 foot bgs samples, as the 0-0.5 foot bgs sample results indicated that mercury was not detected above the reporting limit.

2.1.2 2015 Sediment Samples

To supplement the 2014 data and answer specific questions relative to CT DEEP requests for additional characterization, 2015 sediment samples were collected for chemical analysis from 76 locations, as follows:

- 114 samples from 58 locations in the Tidal Flats, and
- 33 samples from 18 locations in the Outfall 008 area.

Sediment samples were collected using a VibraCore rig mounted on a barge and operated by TGB Marine Services. A summary of coring locations, coordinates, penetration depths, and recovery are presented as **Appendix B**.

Characterization of Sediments between the Tidal Flats and the Housatonic River Channel

Locations of sediment cores with proposed sampling intervals of 0-1, 1-2, and 2-4 foot bgs collected between the Tidal Flats and the margin of the dredged Housatonic River channel (as defined by dredging activities of the USACE in 2012), are presented on **Figure 2-2** as blue diamonds. For each of the 2-4 foot sample intervals, the 2-3 foot interval and the 3-4 foot interval samples were held by the laboratory for potential future analysis pending results of the shallower sample intervals. Based on analytical results from shallower intervals indicating either average ERM-Q values for the eight metals > 0.5 or PCBs > 1 ppm, a subset of the 2-3 foot and 3-4 foot interval samples were taken off hold and analyzed by the laboratory.

Several proposed sediment samples could not be collected, after multiple attempts, due to refusal of the coring device on coarse gravel and rocks, shell fragments, or peat/vegetative matter (see **Appendix B**). The locations of the samples that could not be collected are presented on **Figure 2-4**.

Sediment samples were analyzed for arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, zinc and PCBs (Aroclors and homologs).

Characterization of Sediments Greater than 2 feet, bgs - Tidal Flats

Within the Tidal Flats, additional sediment samples were collected from 2-4 feet bgs at a lower density than samples collected in 2014 from the 0-2 foot bgs interval. Specifically, the areas previously proposed for remediation in the 1-2 foot bgs interval in the Tidal Flats were sampled to evaluate sediment chemistry at depths greater than 2 feet bgs. The proposed locations of these sediment samples are represented as yellow pentagons on **Figure 2-2**. For each of the 2-4 foot bgs sample intervals collected, the 2-3 foot bgs sample interval was analyzed, and the 3-4 foot bgs sample interval was held by the laboratory for future analysis pending results of the shallower interval. Based on analytical results from shallower intervals indicating either average ERM-Q values for the eight metals > 0.5, or PCBs > 1 ppm, a subset of the 2-3 foot and 3-4 foot interval samples were taken off hold and analyzed by the laboratory. Sediment samples were analyzed

for arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, zinc and PCBs (Aroclors and homologs).

In addition, sediment cores were collected near the former wastewater outfalls in the Tidal Flats, at intervals of 3-4, 5-6, and 7-8 feet bgs (see **Figure 2-2**). These samples were analyzed for arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, zinc and PCBs (Aroclors and homologs).

Several proposed sediment samples could not be collected, after multiple attempts, due to refusal of the coring device on dense material, poor recovery, or peat/vegetative matter (see **Appendix B**). The locations of the samples that could not be collected are presented on **Figure 2-4**.

Characterization of Sediments Greater than 2 feet, bgs – Outfall 008

Within the Outfall 008 area, additional sediment samples were collected from the 2-4 feet, bgs interval along the entire portion of the drainage ditch, as presented in **Figure 2-3**. For each of the 2-4 foot sample intervals, the 2-3 foot interval was analyzed and the 3-4 foot sample interval was held by the laboratory for potential future analysis pending results of the shallower interval. The majority of 3-4 foot interval samples were analyzed by the laboratory. Sediment samples were analyzed for arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, zinc, asbestos, and PCBs (Aroclors and homologs).

Several proposed sediment samples could not be collected, after multiple attempts, due to poor recovery and/or samples consisting primarily of peat. The samples that could not be collected are presented on **Figure 2-45**.

Additional Sediment Sample Analyses Requested by USACE

In addition to the analyses referenced above, the U.S. Army Corps of Engineers (USACE) New England District requested that certain samples collected in 2015 also be analyzed for PCB congeners, PAHs, and TOC. The last three columns in **Table 2-1** indicate the 2015 samples selected for these analyses.

2.2 Data Validation

A chemist review was completed for all laboratory analyses to evaluate data quality in support of the CT DEEP Reasonable Confidence Protocols (RCPs). Data quality evaluations were completed using quality control (QC) limits specified by the CTDEEP RCPs and York Analytical Laboratory. If data quality issues were identified during the review, results were qualified in the final data set and interpretations on data biases provided. Data qualifications were completed using the professional judgment of the validation chemist and general procedures specified in Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996). Chemist review summaries for the 2014 sediment 0-0.5 foot and 1-2 foot sample analyses can be found in **Appendices C-1** and **C-2**, respectively. Chemist review summary of the 2015 sediment sample analyses is presented in **Appendix C-3**.

3.0 SEDIMENT ANALYTICAL RESULTS

The following subsections present a summary of sediment analytical results for the Background/Reference Area, Tidal Flats, and Outfall 008 drainage area. The focus of the analytical discussions in this section are primarily on 1) calculated average ERM-Q values for the eight metals arsenic, cadmium, chromium, copper, lead, mercury, nickel, silver, zinc, 2) total PCBs, and 3) mercury. Locations of sediment samples are presented in **Figures 2-1** through **2-3**. Detected analytes in sediment samples for each of the three areas are presented in **Table 3-1**. Complete analytical results for sediments collected during the 2014 and 2015 field programs are presented in **Appendix D**. Grain size data for 2014 and 2015 sediment samples can be found in **Appendix E**. Analytical results for sediment samples collected at the SAEP prior to April 2014 (i.e., the 2-4 foot bgs depth interval) can be found in Appendix A of the Final Work Plan (AMEC, 2014a).

The average ERM-Q for the eight metals for each sample was calculated as follows:

- dividing the actual sediment metal concentration (for non-detects, the detection limit numeric value was used) at each sample location by the published Effects Range-Medium (ER-M) value (Long, et al. 1995) for the metal; and
- calculating the average of the ER-M ratios for the eight metals at each sample location to derive an average ERM-Q for that sample.

As an example, the following table provides the data and ERM-Q calculations for each metal, as well as the average of the ERM-Q for the 8 metals for sample SD14TFA100FS:

Metal	Concentration (mg/kg)	ER-M Value	Individual Metal ERM-Q*
Arsenic	5.82	70	0.08
Cadmium	1.8	9.6	0.19
Chromium	227	370	0.61
Copper	440	270	1.63
Lead	47.5	218	0.22
Nickel	26.5	51.6	0.51
Silver	1.94	3.7	0.52
Zinc	197	410	0.48
Average ERM-Q for 8 Metals:			0.53

* - calculated by dividing concentration of the metal by the ER-M value

The values of the individual metals concentrations for each sample, the ER-M value for each of the eight metals, and the calculated average ERM-Q for each sample are presented in **Table 3-2**.

For the majority of sediment samples collected in 2014 and 2015, both homolog and Aroclor PCB analyses were conducted. The discussions of PCB contamination below incorporate both total homolog and total Aroclor results.

3.1 Background/Reference Area Sediment Chemistry

The locations of Background/Reference Area sediment samples collected in April-May 2014 are presented in **Figure 2-1**. **Table 2-1** presents the analytical methods used for each of the samples. Analytes detected in Background/Reference Area samples are presented in **Table 3-1**. The following paragraphs present a summary by chemical class of the analytes detected in these samples.

PCBs

The only PCB Aroclor detected in the Background/Reference Area sediment samples was Aroclor 1016, at locations SD2014-REF-18 and SD2014-REF-US001A, at concentrations of 0.066 mg/kg and 0.114 mg/kg, respectively (see **Table 3-1**). PCB homologs were not detected in Background/Reference Area sediment samples.

Metals

Metals detected in the Background/Reference Area sediments are arsenic, chromium, copper, lead, manganese, nickel, and zinc (see **Table 3-1**). Cyanide, antimony, cadmium, selenium, and silver were not detected in Background/Reference Area samples. Average ERM-Q values for the eight metals in the Background/Reference area sediments range from 0.07 to 0.25.

PAHs

Polynuclear aromatic hydrocarbons (PAHs) were detected in all Background/Reference Area sediment samples analyzed for SVOCs, and include the analytes acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(ghi)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene.

TOC

TOC values in Background/Reference Area sediment samples ranged from 1,770 mg/kg to 21,800 mg/kg.

3.2 Tidal Flats Sediment Chemistry

Sediments in the Tidal Flats contain metals, PCBs, and PAHs at concentrations exceeding those in reference locations (AMEC, 2014b). The distribution patterns of these analytes vary, but they are generally found at higher concentrations adjacent to the Dike near the former wastewater outfalls. In general, the concentrations of these analytes are highest in the 0-0.5 foot, below ground surface (bgs) interval, and generally decrease to concentrations equivalent to background at depths greater than 2 feet bgs. Exceptions to this trend are noted in the discussions below.

3.2.1 Metals Average ERM-Q

As indicated above, the focus of this subsection is to discuss the results of the calculated average ERM-Q values relative to the remedial target of 0.5. The calculated average ERM-Q values for each sample are presented in **Table 3-2**, and plotted on **Figures 3-1** through **3-4**, for the depth intervals from 0-1, 1-2, 2-3, and 3-4 feet bgs, respectively.

For the Tidal Flats the 0-1 foot, bgs interval, average ERM-Q values range from 0.05 to 2.55 (**Figure 3-1**). Most the 0-1 foot bgs interval in the Tidal Flats has average ERM-Qs > 0.5, with the highest values located near the outfalls along the Dike. Areas outside the immediate perimeter of the Causeway and bordering the Housatonic River Channel have average ERM-Qs < 0.5.

In the 1-2 foot bgs interval, average ERM-Q values are generally lower than the 0-1 foot bgs interval, and range from 0.06 to 3.85 (**Figure 3-2**). Less than half of the Tidal Flats area has average ERM-Q values > 0.5. The highest average ERM-Q values are near the outfalls along the western portion of the Dike, and adjacent to the breakwater along the Housatonic River.

average ERM-Q values in the 2-3 foot bgs interval are generally lower than the 1-2 foot bgs interval, and range from 0.06 to 2.44 (**Figure 3-3**). average ERM-Q values > 0.5 are limited to the tip of the Causeway and the eastern end of the breakwater along the Housatonic River. The locations where average ERM-Q values exceed 0.5 would appear to indicate a source of metals contamination different than that of the outfalls along the Dike, except for location SD2014-TF-LF3 (see **Figure 3-3**).

average ERM-Q values in the 3-4 foot bgs interval are generally consistent with the 2-3 foot bgs interval, and range from 0.06 to 2.14 (**Figure 3-4**). Like the 2-3 foot bgs interval, the average ERM-Q values > 0.5 are limited to the tip of the Causeway and the eastern end of the breakwater along the Housatonic River. Again, the locations where average ERM-Q values exceed 0.5 would appear to indicate a source of metals contamination different than that of the outfalls along the Dike, as evidenced by average ERM-Q values < 0.5 adjacent to the outfalls along the western portion of the Dike (see **Figure 3-4**). The exceptions being the locations SD2014-TF-LF3 and SD2015-TF-H1 (see **Figure 3-4**).

average ERM-Qs for the 5-6 and 7-8 foot bgs sample intervals, limited to areas adjacent to the outfalls along the Dike, were all less than 0.5, and ranged from 0.11 to 0.27 (see **Table 3-1**).

3.2.2 Total PCBs

For the 0-1 foot bgs interval of the Tidal Flats sediments, total PCBs exceed 1.0 ppm in two samples adjacent to Dike outfalls, and two samples on the western edge of the Causeway (**Figure 3-5**). These locations are coincident with average ERM-Q values > 0.5.

Total PCBs in the 1-2 foot bgs interval are all < 1.0 ppm (**Figure 3-6**). Detectable PCBs are limited to three outfalls along the Dike, the tip of the Causeway, and the breakwater along the Housatonic River, which is generally consistent with average ERM-Q values > 0.5 in the same depth interval (**Figure 3-2**). Again, like the EMR-Q values, the locations where detectable PCBs

were found (tip of Causeway and the breakwater) would appear to indicate a source of PCB contamination different than that of the outfalls along the Dike.

In the 2-3 foot bgs interval, Total PCB concentrations exceed 1.0 ppm to the west of the tip of the Causeway (locations SD2014-TF-G5 and SD2014-TF-GH5) and at location SD2014-TF-L3 (**Figure 3-7**). Like the 1-2 foot bgs interval, the detections of PCBs were limited to the outer fringes of the Tidal Flats. PCBs were not detected at the outfall locations along the Dike.

Total PCBs detected in the 3-4 foot bgs interval were evident along the Dike at several of the outfalls, the outer fringes of the Tidal Flats, and at location SD2014-TF-L3 (**Figure 3-8**). The lone location with a total PCB concentration > 1.0 ppm was SD2015-TF-GH12 adjacent to outfall OF-005.

Analysis of total PCBs in the 5-6 and 7-8 foot bgs sample intervals, limited to areas adjacent to the outfalls along the Dike, indicated detections at only one location (SD2015-TF-D0) in both sample intervals (**Figures 3-9 and 3-10**). Total PCB concentrations exceeded 1.0 ppm in the 7-8 foot bgs sample interval (see **Figure 3-10**).

3.2.3 Total Mercury

For the 0-1 foot bgs interval of the Tidal Flats sediments, total mercury was detected only in sediments at the outer fringes of the Tidal Flats (**Figure 3-11**). Concentrations of detectable total mercury ranged from 0.06 to 0.57 ppm. The detections of total mercury were limited to the outer fringes of the Tidal Flats, and suggest that the outfalls may not be the source of detected total mercury in the 0-1 foot bgs interval.

The number of samples analyzed for mercury in the 1-2 foot depth interval is limited to the outer fringes of the Tidal Flats, as 2014 sediment samples from this interval were not analyzed for total mercury. The samples in which total mercury was detected indicated concentrations ranging from 0.05 to 0.58 ppm (**Figure 3-12**).

For the 2-3 foot bgs sample interval, total mercury was detected at concentrations exceeding 3.0 ppm in the outer fringes of the Tidal Flats, near the tip of the Causeway and along the eastern end of the breakwater (**Figure 3-13**). The samples in which mercury was detected indicated concentrations ranging from 0.12 to 3.64 ppm. The distribution, and the lack of detectable total mercury near the outfalls, again indicates a potential source of sediment contamination from sources not associated with the SAEP facility.

Total mercury detected in the 3-4 foot bgs sample interval indicates concentrations ranging from 0.08 to 8.17 ppm, with the highest concentrations near outfalls OF-005 and OF-006, in addition to isolated locations along the breakwater, at the tip of the Causeway, and at location SD2014-TF-L3 (**Figure 3-14**).

Analysis of total mercury in the 5-6 foot bgs sample interval, limited to areas adjacent to the outfalls along the Dike, indicated detections at only two locations adjacent to outfalls OF-001 and OF-006, at concentrations < 0.3 ppm (**Figure 3-15**). Total mercury was not detected in the 7-8 foot bgs sample interval (**Figure 3-16**).

3.3 Outfall 008 Sediment Chemistry

Sediments in the Outfall 008 Drainage Ditch contain metals and PCBs at concentrations greater than Background/Reference locations (AMEC, 2014b). Concentrations of cadmium, chromium, copper, lead, nickel, silver, and zinc detected in sediment samples were all above Background/Reference location sample concentrations. In 2015, CT DOT remediated and restored the areas of Raymark Waste adjacent to the Outfall 008 drainage ditches. The restoration of these areas appears to have slightly altered the drainage ditches. Therefore, the concentrations of metals and PCBs in the shallower (i.e., 0-1 and 1-2 foot bgs) sample intervals (collected spring 2014) may not represent current conditions in these sections of the drainage ditch. The 2-3 and 3-4 foot bgs samples (collected in April 2015) are likely still representative of current conditions.

3.3.1 Metals Average ERM-Q

As indicated above, the focus of this subsection is to discuss the results of the calculated average ERM-Q values relative to the remedial target of 0.5. The calculated average ERM-Q values for each sample are presented in **Table 3-2**, and plotted on **Figures 3-17** through **3-20**, for the depth intervals from 0-1, 1-2, 2-3, and 3-4 feet bgs, respectively.

For the Outfall 008 drainage ditch the clear majority of samples from the 0-1, 1-2, 2-3, and 3-4 foot bgs samples have calculated average ERM-Q values exceeding 0.5 (**Figures 3-17 through 3-20**). However, the extent of metals average ERM-Q values > 0.5 does decrease in the 3-4 foot bgs interval.

3.3.2 Total PCBs

For the 0-1 and 1-2 foot bgs sediment sample intervals in the Outfall 008 drainage, concentrations of total PCBs were < 1.0 ppm (**Figures 3-21** and **3-22**).

Total PCBs in the 2-3 foot bgs interval were detected at concentrations > 1.0 ppm in the majority of the samples, with the exception of the first 250 feet east from the outfall OF-008. (**Figure 3-23**).

In the 3-4 foot bgs interval, the extent of total PCBs with concentrations > 1.0 ppm is much less than the 2-3 foot bgs interval, with only four sample locations in the eastern portion of the drainage exhibiting concentrations > 1.0 ppm (see **Figure 3-24**).

3.3.3 Mercury

For the 0-1 foot bgs interval of the Outfall 008 drainage area sediments, mercury was not detected (**Figure 3-25**). 1-2 foot bgs sediment samples collected in 2014 were not analyzed for mercury (see **Table 2-1**).

For the 2-3 and 3-4 foot bgs sample intervals, mercury was detected in over half the samples at concentrations less than the proposed background value of 0.55 ppm, with only one location in each interval having a concentration marginally exceeding 0.55 ppm (**Figures 3-26** and **3-27**).

3.4 Summary of Contamination

The following subsections present a summary of detected contaminants in sediment for the Tidal Flats and Outfall 008 areas.

3.4.1 Tidal Flats

The data indicate a general decrease in metals and PCB concentrations with depth, with the exception being the area around the tip of the Causeway, as well as the outer fringes of the Tidal Flats adjacent to the breakwater and toward the Housatonic River channel. The additional data collected at the outer limits of the Tidal Flats support prior interpretations that there may be a source(s) of contamination, which are not associated with the SAEP facility, transported to the Tidal Flats by the Housatonic River. This interpretation is supported by average ERM-Q of metals, total PCB, and mercury distributions in the 2-3 and 3-4 foot bgs sample intervals.

Total PCBs exceeding 1.0 ppm, and mercury concentrations greater than the proposed background value of 0.55 ppm, are generally co-located with samples having an average ERM-Q > 0.5.

The 5-6 and 7-8 foot bgs figures indicate no criteria exceeded, with the exception of a 7-8 foot bgs Total PCB concentration > 1.0 ppm along the Dike near outfalls OF-002 & OF-003.

3.4.2 Outfall 008

average ERM-Q values generally exceed 0.5 along the entire length of the drainage area ditches between 0 and 4 feet bgs, with few exceptions.

Concentrations of total PCBs and mercury in the 0-1 and 1-2 foot bgs intervals are generally non-detect or less than 1.0 ppm and 0.55 ppm, respectively. In the 2-3 and 3-4 foot bgs sample intervals, the concentrations of total PCBs increase, and are present at concentrations > 1.0 ppm. Mercury concentrations in the sediments of the ditch from the 2-3 and 3-4 foot bgs intervals are less than the proposed background value of 0.55 ppm, with the exception of one sample in each of the intervals at a concentration of 0.77 ppm each (see **Figures 3-26** and **3-27**).

In the summer of 2015, the CT DOT excavated the Raymark Waste adjacent to the Outfall 008 Drainage Ditch (see **Figure 1-3**), slightly altering the drainage ditch sections adjacent to the former waste. Because of the partial excavation and restoration of these sections of the drainage ditch, the results of the 2014 0-2 feet bgs sediment samples may no longer be representative of actual conditions in these sections of the drainage ditch.

4.0 PROPOSED SEDIMENT REMEDIATION FOOTPRINT

The following sections present proposed remedial footprints and estimated volumes of sediment to be removed from the Tidal Flats Area and Outfall 008 Drainage Ditch. In addition, proposed additional investigations of the Tidal Flats Area are presented.

4.1 Proposed Remedial Footprints and Estimated Removal Volumes for the Tidal Flats Area Sediments

To determine the remedial footprint for the Tidal Flats area, historic data for the period 1992-2015 were plotted on figures by depth interval. Sample locations with an average ERM-Q value greater than or equal to 0.5 were considered to require remediation. For each depth interval, interpolated areas of sediments with average ERM-Q values greater than or equal to 0.5 were drawn. **Figures 4-1 through 4-6** present the sediment average ERM-Q values and an interpolated remedial footprint for the depth intervals 0-1, 1-2, 2-3, 3-4, 5-6, and 7-8 feet bgs, respectively. As indicated in the figures, partial remediation of sediments in the 0-1, 1-2, 2-3, and 3-4 foot bgs depth intervals is proposed. Currently no remediation is proposed below 4 feet bgs, as there are no average ERM-Q values > 0.5; however, additional proposed investigations are discussed below which may result in remediation below 4 feet bgs.

The historical total PCBs (both Aroclors and Homologs) data were plotted by depth interval to evaluate total PCB concentrations relative to the average ERM-Q based remedial footprint. **Figures 4-7 through 4-12** present the total PCB concentrations, as well as the average ERM-Q based remedial footprint, for the depth intervals 0-1, 1-2, 2-3, 3-4, 5-6, and 7-8 feet bgs, respectively. The following bullets present a summary by depth interval of the evaluation of total PCB concentrations relative to the average ERM-Q based remedial footprints:

- 0-1 foot bgs: Samples with total PCB concentrations > 0.5 ppm fall within the average ERM-Q remedial footprint. The sample at grid location G6 with a total PCB concentration of 0.29 ppm was not included in the remedial footprint (see **Appendix F** for rationale).
- 1-2 feet bgs: Samples with total PCB concentrations > 0.2 ppm fall within the average ERM-Q remedial footprint. The exception is sample SD15TFG601FS at grid location G6 with a total PCB concentration of 0.26 ppm (see **Appendix F** for rationale).
- 2-3 feet bgs: Samples with total PCB concentrations > 0.2 ppm fall within the average ERM-Q remedial footprint. The exception is sample SD15TFG602FS at grid location G6 with a total PCB concentration of 0.53 ppm (see **Appendix F** for rationale).
- 3-4 feet bgs: Samples with total PCB concentrations > 0.2 ppm fall within the average ERM-Q remedial footprint.
- 5-6 feet bgs: There are no samples in this depth interval with total PCB concentrations > 0.15 ppm.
- 7-8 feet bgs: Except for one sample at grid location D0, there are no samples in this depth interval with detectable PCB concentrations. The detection of total PCBs at location D0

up to 3.32 ppm has led to the Army proposing further delineation of sediments near the facility discharge outfalls in the 4-8 foot bgs depth interval (see **Appendix F**). The proposed additional sampling is presented in Section 4.2.

The historical mercury data were plotted by depth interval to evaluate mercury concentrations relative to the average ERM-Q based remedial footprint. **Figures 4-13** through **4-18** present the mercury concentrations, as well as the average ERM-Q based remedial footprint, for the depth intervals 0-1, 1-2, 2-3, 3-4, 5-6, and 7-8 feet bgs, respectively. The following bullets present a summary by depth interval of the evaluation of mercury concentrations relative to the average ERM-Q based remedial footprints:

- **0-1 foot bgs (Figure 4-13):** Samples with mercury concentrations greater than the proposed background concentration of 0.4 ppm fall within the average ERM-Q remedial footprint. The highest mercury concentration in samples outside the proposed remedial footprint is 0.38 ppm.
- **1-2 foot bgs (Figure 4-14):** Samples with mercury concentrations greater than the proposed background concentration of 0.4 ppm fall within the average ERM-Q remedial footprint, with two exceptions. The samples SD15TFG601FS, SDTB007B, and SDTC007B with total mercury concentrations of 0.58, 0.53, and 0.64 ppm, respectively, are not included in the remedial footprint (see **Appendix F** for rationale for exclusion of sample location SD15TFG601FS).
- **2-3 foot bgs (Figure 4-15):** Samples with total mercury concentrations greater than the proposed background concentration of 0.4 ppm fall within the average ERM-Q remedial footprint, with two exceptions. The samples SD15TFG602FS and TA4 (2-4 foot bgs) with total mercury concentrations of 0.64 and 0.7 ppm, respectively, are not included in the remedial footprint.
- **3-4 foot bgs (Figure 4-16):** Samples with mercury concentrations greater than the proposed background concentration of 0.4 ppm fall within the average ERM-Q remedial footprint, with one exception. Sample TA4 (2-4 foot bgs) with a total mercury concentration of 0.7, respectively, is not included in the remedial footprint.
- **5-6 foot bgs (Figure 4-17):** Mercury concentrations in this depth interval are less than 0.25 ppm.
- **7-8 foot bgs (Figure 4-18):** Mercury concentrations in this depth interval are less than the proposed background concentration of 0.4 ppm.

Figure 4-19 presents the proposed remedial footprint for Tidal Flats Area sediments based on the discussions above. The following table presents a summary of the estimated volume of sediments proposed for removal from the Tidal Flats Area:

Depth Interval	Area (square feet)	Volume (cubic yards)
0-1 ft	1,965,888	72,811
1-2 ft	1,143,248	42,343

Depth Interval	Area (square feet)	Volume (cubic yards)
2-3 ft	388,341	14,383
3-4 ft	270,903	10,033
Total (0-4 ft)	3,768,330	139,570

4.2 Proposed Additional PCB Delineation in the Tidal Flats Area

Additional sampling of sediments within the Tidal Flats area is required to:

- 1) delineate Total PCB concentrations at depths between 4 and 8 feet bgs at selected facility discharge outfalls, and
- 2) delineate more definitively the total PCB concentrations greater than or equal to 50 ppm in the 0-2 foot depth interval.

These proposed investigations are discussed briefly below. The details regarding the investigations will be presented in a Field Sampling Plan to be issued by the Army in early June 2017.

4.2.1 Outfall-Area PCB Sampling

Sediment samples near Outfalls 001, 002, 003, 004, and 007, will be proposed for the depth intervals 4-5', 5-6', 6-7', and 7-8'. The purpose of these samples is to evaluate PCB concentrations at depth around outfall locations, which are suspected sources of PCBs to the Tidal Flats. The Army agreed to conduct additional sampling at these locations in response to CT DEEP's May 17, 2017 comments on the Sediment Remediation Endpoints Report (see **Appendix F**). The Army has proposed that if total PCB concentrations of any sample exceeds 1 ppm, then the sediment within the depth interval out to a radius of 50 feet from the sample will be included in the remedial action.

4.2.2 Further PCB Delineation

The USEPA Region 1 has requested additional delineation of total PCBs greater than or equal to 50 ppm currently identified in the 0-2 foot depth interval of the Tidal Flats sediments. The Army will collect additional samples in consultation with USEPA at these PCB locations.

4.3 Proposed Remedial Footprints and Estimated Removal Volumes for Outfall 008 Drainage Ditch Sediments

As discussed on the May 22, 2017 conference call with CT DEEP, the Army agreed to remediate the entire length of the Outfall 008 drainage ditch (inclusive of the "T" section extending to Route 113 to the southwest and Marine Basin to the northeast) to a depth of 4 feet bgs. The proposed remedial footprint for the 0-4 foot depth interval is depicted in **Figure 4-20**. The following table

Sediment Remediation Endpoints Report
Tidal Flats and Outfall 008
Stratford Army Engine Plant, Stratford, Connecticut

presents the estimated volume of sediments proposed for removal from the Outfall 008 Drainage Ditch:

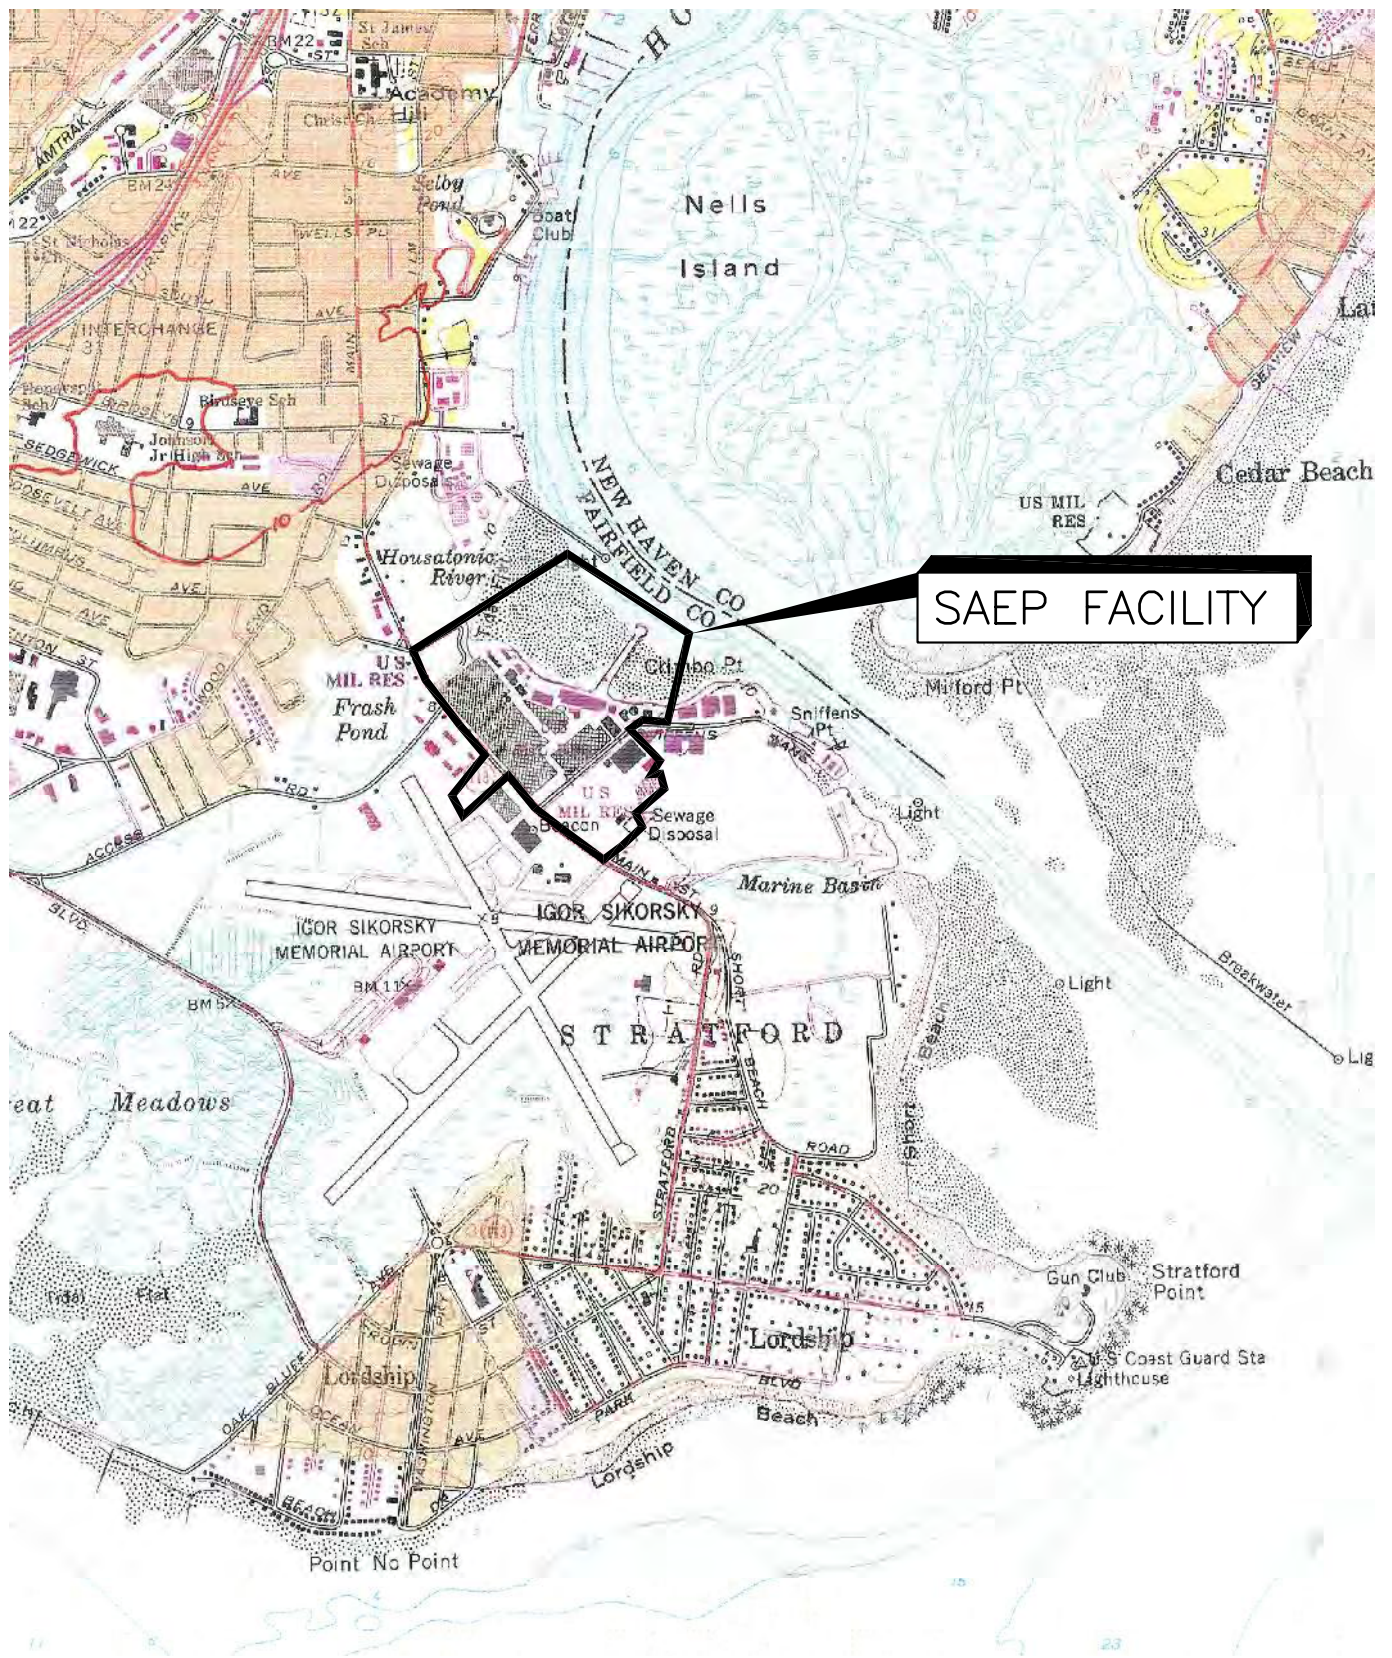

Depth Interval	Area (square feet)	Volume (cubic yards)
0-1 ft	138,923	1,275
1-2 ft	138,923	1,275
2-3 ft	138,923	1,275
3-4 ft	138,923	1,275
Total (0-4 ft)	555,692	5,170

Notes:

ERM-Q - effects range median quotient for eight metals (value is an average of the ERM-Qs for the eight metals in each sample)

*- metal used in calculation of ERM-Q

Red/bold font indicates average ERM-Q > 0.5, which requires remediation

Data in the table is for analytes detected at least once in the 2014-15 sediment sampling program

FD - field duplicate

MG/KG - milligrams per kilogram (equivalent to parts per million)

R - rejected result

U - not detected

J - estimated value

The average ERM-Q for the eight metals for each sample was calculated as follows:

- dividing the actual sediment metal concentration (for non-detects, the detection limit numeric value was used) at each sample location by the published Effects Range-Medium (ER-M) value (Long, et al. 1995) for the metal; and
- calculating the average of the ER-M ratios for the eight metals at each sample location to derive an average ERM-Q for that sample.

As an example, the following table provides the data and ERM-Q calculations for each metal, as well as the average of the ERM-Q for the 8 metals for sample SD14TFA100FS:

Metal	Concentration (mg/kg)	ER-M Value	Individual Metal ERM-Q*
Arsenic	5.82	70	0.08
Cadmium	1.8	9.6	0.19
Chromium	227	370	0.61
Copper	440	270	1.63
Lead	47.5	218	0.22
Nickel	26.5	51.6	0.51
Silver	1.94	3.7	0.52
Zinc	197	410	0.48
Average ERM-Q for 8 Metals:			0.53

* - calculated by dividing concentration of the metal by the ER-M value

**TABLE 3-2
AVERAGE ERM-Q CALCULATED VALUES**

**SEDIMENT REMEDIATION ENDPOINTS REPORT
STRATFORD ARMY ENGINE PLANT
STRATFORD, CONNECTICUT**

Area	Location ID	Field Sample ID	Top Depth (ft, bgs)	Bottom Depth (ft,bgs)	Metals Concentrations (mg/kg)								Average ERM-Q
					Arsenic	Cadmium	Chromium	Copper	Lead	Nickel	Silver	Zinc	

Notes: ER-M - effects range median (Long and Morgan, 1990)

ERM-Q - effects range median quotient for eight metals (value is an average of the individual ERM-Qs for the eight metals in each sample)

Red/bold font indicates average ERM-Q > 0.5, which requires remediation

mg/kg - milligrams per kilogram (equivalent to parts per million)

Data in the table is from the 2014-15 sediment sampling program only

The average ERM-Q for the eight metals for each sample was calculated as follows:

- dividing the actual sediment metal concentration (for non-detects, the detection limit numeric value was used) at each sample location by the published Effects Range-Medium (ER-M) value (Long, et al. 1995) for the metal; and
- calculating the average of the ER-M ratios for the eight metals at each sample location to derive an average ERM-Q for that sample.

As an example, the following table provides the data and ERM-Q calculations for each metal, as well as the average of the ERM-Q for the 8 metals for sample SD14TFA100FS:

Metal	Concentration (mg/kg)	ER-M Value	Individual Metal ERM-Q*
Arsenic	5.82	70	0.08
Cadmium	1.8	9.6	0.19
Chromium	227	370	0.61
Copper	440	270	1.63
Lead	47.5	218	0.22
Nickel	26.5	51.6	0.51
Silver	1.94	3.7	0.52
Zinc	197	410	0.48
Average ERM-Q for 8 Metals:			0.53

* - calculated by dividing concentration of the metal by the ER-M value

1.0 INTRODUCTION

One hundred fourteen sediment samples were collected in April 2014 and May 2014 at SAEP located in Stratford, Connecticut. Samples were analyzed by YORK Analytical Laboratories, Inc (YORK) of Stratford, Connecticut. The following U.S. Environmental Protection Agency (USEPA) analytical methods (USEPA, 1996a) were performed:

- Semivolatile Organic Compounds (SVOCs) by USEPA Method 8270D
- Polynuclear Aromatic Hydrocarbons (PAHs) by USEPA Method 8270 Selective Ion Monitoring (SIM)
- Polychlorinated Biphenyls (PCBs) by USEPA Method 8082A
- PCBs Homologs by Modified EPA Method 680
- Metals by USEPA Methods 6020A/7471B
- Total Organic Carbon (TOC) by Method Lloyd Kahn
- Total Cyanide by USEPA Methods 9014/9010C

A chemist review was completed for all analyses to evaluate data quality in support of the Connecticut Department of Energy and Environmental Protection Recommended Reasonable Confidence Protocols (RCPs) [CTDEEP, 2010a; CTDEEP, 2010b]. Samples included in this data evaluation are presented in Table 1. Data quality evaluations were completed using quality control (QC) limits specified by the CTDEEP RCPs and the subcontract laboratory presented in Table 2. If data quality issues were identified during the review, results were qualified in the final data set and interpretations on data biases provided. Data qualifications were completed using the professional judgment of the validation chemist and general procedures specified in Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996b).

Data qualifications were completed if necessary in accordance with the guidelines or the professional judgment of the project chemist using the following qualifiers:

- J = The reported concentration is considered an estimated value
- U = The target compound was not detected above the reporting limit (RL)
- UJ = The target compound was not detected and the RL is considered to be estimated
- R = The reported value is rejected and considered to be unusable

Validation reason codes were applied to results associated with QC measurements outside project QC goals. The validation qualification actions and associated validation reason codes applied to sample results are summarized on Table 3. The following data validation reason codes were applied to one or more sample results:

- FD = Field duplicate relative percent difference (RPD) limit exceeded
- HT = Holding time exceeded
- HT-G = Holding time grossly exceeded
- LCS-H = Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) recovery high
- LCS-L = LCS/LCSD recovery low
- LCS-RPD = LCS/LCSD RPD limit exceeded

MS-L = MS/MSD recovery low
MS-RPD = MS/MSD RPD limit exceeded
PM = Percent moisture exceeds EPA guideline
SS-L = Surrogate recovery low

A complete summary of final sample results is provided in Table 4.

Data were evaluated based on the following parameters where applicable:

- Sample Collection and Preservation
- Data Completeness
- Holding Times
- Surrogate Recoveries
- * Blank Contamination
- Field Duplicates
- LCS/LCSD
- MS/MSD
- * Reporting Limits (RLs)
- Data Package Narrative Review

* - all criteria were met for this parameter

In addition to the above QC evaluations performed as part of the chemist review, any issues with instrument calibration and target compound quantitation noted in the lab data package narratives are summarized in this report. A review of these QC parameters is outside the scope of the chemist review and data qualifiers are not applied for these issues.

A subset of samples was analyzed at dilution due to high target compound concentrations and/or matrix interference. Reporting limits for non-detect results are elevated.

With the exception of the following items discussed below, results were determined to be usable as reported by the laboratory.

2.0 SVOCs

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). All SVOCs in sample SD14TFZA4500FS were reported as not detected and were qualified as rejected (R).

Data Completeness

14F1203 – Due to a laboratory error, SVOC samples SD14TFK401FS and SD14TFK401FS were not analyzed.

Surrogate Recoveries

14D0945 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14OF81700FS (14/25), SD14OF81600FS (22/20), and SD14OF81300FS (26/20), which may indicate low bias. All base-neutral compounds in samples

SD14OF81700FS, SD14OF81600FS, and SD14OF81300FS were reported as not detected and reporting limits were qualified as estimated (UJ). Some compounds were subsequently rejected (R) due to low LCS recoveries.

14D1010 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFK200FS (4/18), SD14OF81200FS (21/23), SD14OF81100FS (29.6/27), SD14OF81000FS (25/23), and SD14OF80700FS (25/23), and surrogates associated with acid compounds had recoveries that were less than the lower QC limit of 30 in sample SD14TFK200FS (5/19), which may indicate low bias. All base-neutral compounds in samples SD14OF81200FS, SD14OF81100FS, SD14OF81000FS, and SD14OF80700FS were reported as not detected and reporting limits were qualified as estimated (UJ). All compounds in sample SD14TFK200FS were reported as not detected and were qualified as rejected (R). Some compounds were subsequently rejected (R) due to low LCS recoveries.

14D1046 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFH200FS (4/11) and SD14TFB100FD (4/11), and surrogates associated with acid compounds had recoveries that were less than the lower QC limit of 30 in sample SD14OF80500FS (9.9), SD14TFDE000FS (5/22), SD14TFB100FD (4/18/20), and SD14TFH200FS (6/24) which may indicate low bias. All acid compounds in sample SD14OF80500FS were reported as not detected and were qualified as rejected (R). All compounds in sample SD14TFH200FS were reported as not detected and were qualified as rejected (R). Sample SD14TFB100FD is the field duplicate of sample SD14TFB100FS. Surrogate recoveries in the sample SD14TFB100FS were all within QC limits. All compounds were reported as not detected in sample SD14TFB100FS and its field duplicate SD14TFB100FD, and based on professional judgment, reporting limits in sample SD14TFB100FD were qualified as estimated (UJ). Sample SD14TFDE000FD is the field duplicate of sample SD14TFDE000FS. Surrogate recoveries in the sample SD14TFDE000FD were all within QC limits. All acid compounds were reported as not detected in sample SD14TFDE000FS and its field duplicate SD14TFDE000FD, and based on professional judgment, reporting limits in sample SD14TFDE000FS were qualified as estimated (UJ). Some compounds were subsequently rejected (R) due to low MS recoveries.

14D1167 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14REF1700FS (11/15), SD14REF1800FS (6/22), SD14REFUS100FS (7/26), SD14TFJ200FS (6/17), SD14TFJ300FS (7/11), SD14TFJ500FS (12/19), SD14TFA200FS (22/20), SD14TFA700FS (23/22), SD14TFB700FS (10/14), SD14TFD100FS (4/16), and SD14TFF100FS (3/23), and surrogates associated with acid compounds had recoveries that were less than the lower QC limit of 30 in samples SD14REF1800FS (4/15), SD14REFUS100FS (5), SD14TFJ200FS (8), SD14TFD100FS (6), and SD14TFF100FS (3/18), which may indicate low bias. All base-neutral compounds in samples SD14REF1700FS, SD14TFJ500FS, SD14TFA200FS, SD14TFA700FS, and SD14TFB700FS were reported as not detected and reporting limits were qualified as estimated (UJ). All base-neutral compounds in samples SD14REF1800FS, SD14REFUS100FS, SD14TFJ200FS, SD14TFJ300FS, SD14TFD100FS, and SD14TFF100FS were reported as not detected and were qualified as rejected (R). All acid compounds in samples SD14REF1800FS, SD14REFUS100FS, SD14TFJ200FS, SD14TFD100FS, and SD14TFF100FS were reported as not detected and were qualified as rejected (R). Some compounds were subsequently rejected (R) due to low LCS recoveries.

14E0005 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFA400FS (22/14), SD14TFB200FS (13/23), SD14TFB400FS (22/17), and SD14TFA500FS (24/19), which may indicate low bias. All base-neutral compounds in samples SD14TFA400FS, SD14TFB200FS, SD14TFB400FS, and SD14TFA500FS were reported as not

detected and reporting limits were qualified as estimated (UJ). Some compounds were subsequently rejected (R) due to low LCS and/or MS recoveries.

14E0079 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFC100FS (2/15), SD14TFF500FS (12/18), and SD14TF400FS (3/10), and surrogates associated with acid compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFC100FS (2/12), SD14TFF500FS (12/20), and SD14TF400FS (4/17), which may indicate low bias. All base-neutral compounds in sample SD14TFF500FS were reported as not detected and reporting limits were qualified as estimated (UJ). All base-neutral compounds in samples SD14TFC100FS, except bis(2-ethylhexyl)phthalate, and SD14TF400FS were reported as not detected and were qualified as rejected (R). The bis(2-ethylhexyl)phthalate detection in sample SD14TFC100FS was qualified as estimated (J). All acid compounds in sample SD14TFF500FS were reported as not detected and were qualified as estimated (UJ). All acid compounds in samples SD14TFC100FS and SD14TF400FS were reported as not detected and were qualified as rejected (R). Some compounds were subsequently rejected (R) due to low LCS recoveries.

14E0166 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFH500FS (9), SD14TFK500FS (5/25), and SD14TFL300FS (3/26), and surrogates associated with acid compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFH500FS (6/24), SD14TFK500FS (4/19), and SD14TFL300FS (2/11), which may indicate low bias. All compounds in samples SD14TFH500FS, SD14TFK500FS, and SD14TFL300FS, except bis(2-ethylhexyl)phthalate in sample SD14TFK500FS, were reported as not detected and reporting limits were qualified as rejected (R). The detection of bis(2-ethylhexyl)phthalate in sample SD14TFK500FS was qualified as estimated (J).

14E0237 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFB300FS (9.7/28), SD14TFB500FS (9/26), SD14TFC400FS (5/29), SD14TFC500FS (6/23), and SD14TFC600FS (5/28), and surrogates associated with acid compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFB500FS (11/27), SD14TFC300FS (11/25), SD14TFC400FS (4/19), SD14TFC500FS (5/23), and SD14TFC600FS (4/18), which may indicate low bias. All base-neutral compounds in samples SD14TFB300FS, SD14TFB500FS, SD14TFC400FS, SD14TFC500FS, and SD14TFC600FS were reported as not detected and were qualified as rejected (R). All acid compounds in samples SD14TFC400FS, SD14TFC500FS, and SD14TFC600FS were reported as not detected and were qualified as rejected (R). All acid compounds in samples SD14TFB500FS and SD14TFC300FS were reported as not detected and were qualified as estimated (UJ).

LCS/LCSD

14D0945 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (21), bis(2-chloroethyl)ether (21), bis(2-chloroisopropyl)ether (19), hexachlorobutadiene (17), hexachlorocyclopentadiene (11), hexachloroethane (9), nitrobenzene (31), pyridine (7), and 1,2,4-trichlorobenzene (23), and percent recoveries less than the lower QC limit of 30 for 2-chlorophenol (27) and 2,4-dinitrophenol (27), which may indicate low bias. Aniline, bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, hexachlorocyclopentadiene, nitrobenzene, 1,2,4-trichlorobenzene, 2-chlorophenol, and 2,4-dinitrophenol were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Hexachloroethane and pyridine were reported as not detected in all associated samples and were qualified as rejected (R).

14D1010 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (25), bis(2-chloroethoxy)methane (31), bis(2-chloroethyl)ether (9), bis(2-chloroisopropyl)ether (6), hexachlorobutadiene (6), hexachlorocyclopentadiene (0), hexachloroethane (0), isophorone (38), 1-methylnaphthalene (37), 2-methylnaphthalene (35), nitrobenzene (18), N-nitroso-di-n-propylamine (23), pyridine (0), and 1,2,4-trichlorobenzene (11), and percent recoveries less than the lower QC limit of 30 for 2-chlorophenol (14), 2-methylphenol (29), 2,4-dinitrophenol (26), and 2-nitrophenol (21), which may indicate low bias. Aniline, bis(2-chloroethoxy)methane, isophorone, 1-methylnaphthalene, 2-methylnaphthalene, nitrobenzene, N-nitroso-di-n-propylamine, 1,2,4-trichlorobenzene, 2-chlorophenol, 2-methylphenol, 2,4-dinitrophenol, and 2-nitrophenol were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, and pyridine were reported as not detected in all associated samples and were qualified as rejected (R). Some compounds were subsequently rejected (R) due to low MS and/or surrogate recoveries.

14D1046 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (31), bis(2-chloroisopropyl)ether (29), hexachlorobutadiene (21), hexachlorocyclopentadiene (24), hexachloroethane (15), pyridine (9), and 1,2,4-trichlorobenzene (26), which may indicate low bias, and a percent recovery greater than the upper QC limit of 140 for bis(2-ethylhexyl)phthalate (166), which may indicate high bias. Aniline, bis(2-chloroisopropyl)ether, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, and 1,2,4-trichlorobenzene, were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Detections of bis(2-ethylhexyl)phthalate in samples SD14TFDE000FS and SD14TFDE000FD were qualified as estimated (J). Pyridine was reported as not detected in all associated samples and was qualified as rejected (R). Some compounds were subsequently rejected (R) due to low MS and/or surrogate recoveries.

14D1130 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (18), bis(2-chloroethyl)ether (18), bis(2-chloroisopropyl)ether (14), hexachlorobutadiene (14), hexachlorocyclopentadiene (0), hexachloroethane (7), nitrobenzene (28), N-nitroso-di-n-propylamine (31), pyridine (5), and 1,2,4-trichlorobenzene (20), and a percent recovery less than the lower QC limit of 30 for 2-chlorophenol (25), which may indicate low bias. Aniline, bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, nitrobenzene, N-nitroso-di-n-propylamine, and 1,2,4-trichlorobenzene were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Hexachlorocyclopentadiene, hexachloroethane, and pyridine were reported as not detected in all associated samples and was qualified as rejected (R).

14D1167 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (36), bis(2-chloroethyl)ether (36), bis(2-chloroisopropyl)ether (39), hexachlorobutadiene (29), hexachlorocyclopentadiene (24), hexachloroethane (19), 4-nitroaniline (0), pyridine (10), and 1,2,4-trichlorobenzene (33), which may indicate low bias, and a percent recovery greater than the QC limit of 140 for bis(2-ethylhexyl)phthalate (180), which may indicate high bias. Aniline, bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, 4- and 1,2,4-trichlorobenzene were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). 4-Nitroaniline and pyridine were reported as not detected in all associated samples and were qualified as rejected (R). The detection of bis(2-ethylhexyl)phthalate in sample SD14TFG300FS was qualified as estimated (J). Some compounds were subsequently rejected (R) due to low MS and/or surrogate recoveries.

14E0005 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (21), bis(2-chloroethyl)ether (21), bis(2-chloroisopropyl)ether (19), hexachlorobutadiene (17), hexachlorocyclopentadiene (11), hexachloroethane (9), nitrobenzene (31), pyridine (7), and 1,2,4-trichlorobenzene (23), and percent recoveries less than the lower QC limit of 30 for 2-chlorophenol (27) and 2,4-dinitrophenol (27), which may indicate low bias. Aniline, bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, hexachlorocyclopentadiene, nitrobenzene, 1,2,4-trichlorobenzene (23), 2-chlorophenol (27), and 2,4-dinitrophenol (27), were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Hexachloroethane and pyridine were reported as not detected in all associated samples and were qualified as rejected (R). Some compounds were subsequently rejected (R) due to low MS recoveries and/or low percent solids.

14E0079 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (25), bis(2-chloroethoxy)methane (31), bis(2-chloroethyl)ether (9), bis(2-chloroisopropyl)ether (6), hexachlorobutadiene (6), hexachlorocyclopentadiene (0), hexachloroethane (0), isophorone (38), 1-methylnaphthalene (37), 2-methylnaphthalene (35), nitrobenzene (18), N-nitroso-di-n-propylamine (23), pyridine (0), and 1,2,4-trichlorobenzene (11), and percent recoveries less than the lower QC limit of 30 for 2-chlorophenol (14), 2-methylphenol (29), 2,4-dinitrophenol (26), and 2-nitrophenol (21), which may indicate low bias. Aniline, bis(2-chloroethoxy)methane, isophorone, 1-methylnaphthalene, 2-methylnaphthalene, nitrobenzene, N-nitroso-di-n-propylamine, 1,2,4-trichlorobenzene, 2-chlorophenol, 2-methylphenol, 2,4-dinitrophenol, and 2-nitrophenol were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, hexachlorocyclopentadiene, hexachloroethane, and pyridine were reported as not detected in all associated samples and were qualified as rejected (R). Some compounds were subsequently rejected (R) due to low surrogate recoveries.

14E0105 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for hexachlorocyclopentadiene (14) and pyridine (17), which may indicate low bias. Hexachlorocyclopentadiene and pyridine were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ).

14E0166 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (18), bis(2-chloroethyl)ether (18), bis(2-chloroisopropyl)ether (14), hexachlorobutadiene (14), hexachlorocyclopentadiene (0), hexachloroethane (7), nitrobenzene (28), N-nitroso-di-n-propylamine (31), pyridine (5), and 1,2,4-trichlorobenzene (20), and a percent recovery less than the lower QC limit of 30 for 2-chlorophenol (25), which may indicate low bias. Aniline, bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, nitrobenzene, N-nitroso-di-n-propylamine, and 1,2,4-trichlorobenzene were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Hexachlorocyclopentadiene, hexachloroethane, and pyridine were reported as not detected in all associated samples and was qualified as rejected (R). Some compounds were subsequently rejected (R) due to low surrogate recoveries.

14E0237 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (18), bis(2-chloroethyl)ether (18), bis(2-chloroisopropyl)ether (14), hexachlorobutadiene (14), hexachlorocyclopentadiene (0), hexachloroethane (7), nitrobenzene (28), N-nitroso-di-n-propylamine (31), pyridine (5), and 1,2,4-trichlorobenzene (20), and a percent recovery less than the lower QC limit of 30 for 2-chlorophenol (25), which may indicate low bias. Aniline, bis(2-chloroethyl)ether, bis(2-chloroisopropyl)ether, hexachlorobutadiene, nitrobenzene, N-nitroso-di-n-propylamine, and 1,2,4-trichlorobenzene were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Hexachlorocyclopentadiene, hexachloroethane, and

pyridine were reported as not detected in all associated samples and was qualified as rejected (R). Some compounds were subsequently rejected (R) due to low surrogate recoveries.

MS/MSD

14D1010 – The MS/MSD associated with sample SD14TFK200FS had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias. All compounds in sample SD14TFK200FS were reported as not detected. Compounds reported as not detected in sample SD14TFK200FS with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in sample SD14TFK200FS with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ). All compounds were subsequently rejected (R) in sample SD14TFK200FS due to low surrogate recoveries.

14D1046 – The MS/MSD associated with sample SD14OF80200FS and its field duplicate SD14OF80200FD had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias, and a RPD greater than the QC limit of 30 for 2,6-dinitrotoluene (33). All compounds in samples SD14OF80200FS and SD14OF80200FD were reported as not detected. Compounds reported as not detected in samples SD14OF80200FS and SD14OF80200FD with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in samples SD14OF80200FS and SD14OF80200FD with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ). 2,6-Dinitrotoluene was reported as not detected in samples SD14OF80200FS and SD14OF80200FD and reporting limits were qualified as estimated (UJ).

14D1046 – The MS/MSD associated with sample SD14TFDE000FS and its field duplicate SD14TFDE000FD had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias. All compounds in samples SD14TFDE000FS and SD14TFDE000FD were reported as not detected. Compounds reported as not detected in samples SD14TFDE000FS and SD14TFDE000FD with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in samples SD14TFDE000FS and SD14TFDE000FD with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ).

14D1046 – The MS/MSD associated with sample SD14TFB100FS and its field duplicate SD14TFB100FD had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias. All compounds in samples SD14TFB100FS and SD14TFB100FD were reported as not detected. Compounds reported as not detected in samples SD14TFB100FS and SD14TFB100FD with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in samples SD14TFB100FS and SD14TFB100FD with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ).

14D1130 – The MS/MSD associated with sample SD14TFA100FS had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias and some RPDs greater than the QC limit of 30. All compounds in sample SD14TFA100FS were reported as not detected. Compounds reported as not detected in sample SD14TFA100FS with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in sample SD14TFA100FS with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ). Compounds reported as not

detected in sample SD14TFA100FS with RPDs greater than 30 had the reporting limits qualified as estimated (UJ).

14D1167 – The MS/MSD associated with sample SD14REF0500FS and its field duplicate SD14REF0500FD had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias. All compounds in samples SD14REF0500FS and SD14REF0500FD were reported as not detected. Compounds reported as not detected in samples SD14REF0500FS and SD14REF0500FD with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in samples SD14REF0500FS and SD14REF0500FD with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ). Some compounds were subsequently rejected (R) due to low LCS recoveries.

14E0005 – The MS/MSD associated with sample SD14TFA0500FS and its field duplicate SD14TFA0500FD had several percent recoveries less than the lower QC limit of 40 for base-neutral compounds and 30 for acid compounds (ranging from 0-39), which may indicate low bias, and a RPD greater than the QC limit of 30 for dibenzofuran (47) and 2,4-dimethylphenol (47). All compounds in samples SD14TFA0500FS and SD14TFA0500FD were reported as not detected. Compounds reported as not detected in samples SD14TFA0500FS and SD14TFA0500FD with percent recoveries less than 10 were qualified as rejected (R). Compounds reported as not detected in samples SD14TFA0500FS and SD14TFA0500FD with percent recoveries greater than 10 but less than the QC limits had the reporting limits qualified as estimated (UJ). Compounds reported as not detected in sample SD14TFA0500FS and SD14TFA0500FD with RPDs greater than 30 had the reporting limits qualified as estimated (UJ).

Data Package Narrative Review

14D0945 – The case narrative noted that the continuing calibration associated with all samples had a percent difference of 44 for hexachlorocyclopentadiene.

14D1010 – The case narrative noted that the continuing calibration associated with all samples analyzed at 1X had percent differences of -38 for aniline and -41 for 4-chloroaniline.

14D1010 – The case narrative noted that the continuing calibration associated with all samples analyzed at 4X had percent differences of -36 for 4-chloroaniline and 53 for hexachlorocyclopentadiene.

14D1046 – The case narrative noted that the continuing calibration associated with all samples analyzed at 4X had percent differences of 48 for 2,4-dinitrophenol and 98 for 4-nitroaniline.

14D1046 – The case narrative noted that the continuing calibration associated with all samples analyzed at 10X had percent differences of 58 for N-nitrosodimethylamine, 59 for pyridine, -33 for 4-chloroaniline, 52 for hexachlorocyclopentadiene, and -35 for pentachloronitrobenzene.

14D1130 – The case narrative noted that the continuing calibration associated with all samples had a percent difference of 64 for hexachlorocyclopentadiene.

14D1167 – The case narrative noted that the continuing calibration associated with all samples analyzed at 1X had percent differences of 41 for aniline and -41 for hexachlorocyclopentadiene.

14D1167 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 4X had percent differences of -31 for pentachloronitrobenzene and -42 for 3,3'-dichlorobenzidine.

14D1167 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 4X had percent differences of 47 for 2-methylphenol, -31 for N-nitroso-di-n-propylamine, 35 for hexachlorocyclopentadiene, 33 for 2,4-dinitrophenol, -47 for pentachloronitrobenzene, and -35 for 3,3'-dichlorobenzidine.

14E0005 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 4X had a percent difference of 55 for hexachlorocyclopentadiene.

14E0005 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X and 4X had percent differences of 60 for hexachlorocyclopentadiene and 39 for 2,4-dinitrophenol.

14E0079 – The case narrative noted that the continuing calibration associated with all samples analyzed at 1X had percent differences of -38 for aniline and -41 for 4-chloroaniline.

14E0079 – The case narrative noted that the continuing calibration associated with all samples analyzed at 4X had percent differences of -36 for 4-chloroaniline and 53 for hexachlorocyclopentadiene.

14E0105 – The case narrative noted that the continuing calibration associated with all samples analyzed at 1X had percent differences of 51 for 2-methylphenol, -32 for 4-chloroaniline, 85 for 2,4-dinitrophenol, and 54 for 4,6-dinitro-2-methylphenol.

14E0105 – The case narrative noted that the continuing calibration associated with all samples analyzed at 4X had percent differences of -63 for hexachlorocyclopentadiene and 31 for pentachlorophenol.

14E0166 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X and 4X had a percent difference of 64 for hexachlorocyclopentadiene.

14E0237 – The case narrative noted that the continuing calibration associated with all samples had percent differences of -140 for 2,4-dinitrophenol, -46 for 4,6-dinitro-2-methylphenol, and 100 for pentachloronitrobenzene.

3.0 PAHs

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). PAHs reported as not detected in sample SD14TFZA4500FS were qualified as rejected (R). PAH detections in sample SD14TFZA4500FS were qualified estimated (J).

Data Completeness

14F1203 – Due to a laboratory error, PAH samples SD14TFK401FS and SD14TFK401FS were not analyzed.

Field Duplicate

14D1046 – RPDs between sample SD14TFDE000FS and its field duplicate SD14TFDE000FD were greater than the QC limit of 50 for acenaphthene (70), benzo(a)anthracene (62), dibenz(a,h)anthracene (52), fluorene (70), and indeno(1,2,3-cd)pyrene (52). Results for acenaphthene, benzo(a)anthracene, dibenz(a,h)anthracene, fluorene, and indeno(1,2,3-cd)pyrene in samples SD14TFDE000FS and SD14TFDE000FD were qualified as estimated (J).

14D1046 – RPDs between sample SD14TFB100FS and its field duplicate SD14TFB100FD were greater than the QC limit of 50 for anthracene (58), benzo(a)pyrene (50.3), benzo(b)fluoranthene (62), benzo(g,h,i)perylene (73), dibenz(a,h)anthracene (200), and indeno(1,2,3-cd)pyrene (66). Results for anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene in samples SD14TFB100FS and SD14TFB100FD were qualified as estimated (J/UJ).

14D1167 – RPDs between sample SD14REF0500FS and its field duplicate SD14REF0500FD were greater than the QC limit of 50 for acenaphthylene (200), anthracene (130), dibenz(a,h)anthracene (200), and phenanthrene (67). Results for acenaphthylene, anthracene, dibenz(a,h)anthracene, and phenanthrene in samples SD14REF0500FS and SD14REF0500FD were qualified as estimated (J/UJ).

14E0005 – RPDs between sample SD14TFA500FS and its field duplicate SD14TFA500FD were greater than the QC limit of 50 for benzo(a)anthracene (200), benzo(a)pyrene (52), benzo(b)fluoranthene (200), benzo(g,h,i)perylene (200), fluoranthene (51), indeno(1,2,3-cd)pyrene (200), and phenanthrene (200). Results for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, fluoranthene, indeno(1,2,3-cd)pyrene, and phenanthrene in samples SD14TFA500FS and SD14TFA500FD were qualified as estimated (J/UJ).

LCS/LCSD

14D0945 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (36/29), acenaphthylene (38), and naphthalene (0/0), which may indicate low bias. Acenaphthene and acenaphthylene were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Naphthalene was reported as not detected in all associated samples and was qualified as rejected (R).

14D1010 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (0/0), acenaphthylene (0/0), fluorene (35/32), and naphthalene (0/0), which may indicate low bias, and a RPD greater than the laboratory QC limit of 30 for benzo(b)fluoranthene (47). Fluorene was reported as not detected in all associated samples, except sample SD14OF81000FS, and reporting limits were qualified as estimated (UJ). Acenaphthene, acenaphthylene, and naphthalene were reported as not detected in all associated samples, except sample SD14OF81000FS, and were qualified as rejected (R). Detections of acenaphthene, acenaphthylene, fluorene, and naphthalene in sample SD14OF81000FS were qualified as estimated (J). Results for benzo(b)fluoranthene were qualified as estimated (J/UJ).

14D1046 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (34), acenaphthylene (30), and naphthalene (31), which may indicate low bias, and a RPD greater than the laboratory QC limit of 30 for acenaphthene (32). Results for acenaphthene, acenaphthylene, and naphthalene were qualified as estimated (J/UJ).

14D1130 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (31) and naphthalene (26/0), which may indicate low bias, and RPDs greater than the laboratory QC limit of 30 for acenaphthene (32) and acenaphthylene (37). Results for acenaphthene and acenaphthylene were qualified as estimated (J/UJ). Naphthalene was reported as not detected in all associated samples and was qualified as rejected (R).

14D1167 – The LCS/LCSD associated with all samples had a RPD greater than the laboratory QC limit of 30 for benzo(b)fluoranthene (40). Detections of benzo(b)fluoranthene in all samples were qualified as estimated (J).

14E0005 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (36/29), acenaphthylene (38) and naphthalene (0/0), which may indicate low bias. Results for acenaphthene and acenaphthylene were qualified as estimated (J/UJ). Naphthalene was reported as not detected in all associated samples, except sample SD14TFA300FS, and was qualified as rejected (R). The naphthalene detection in sample SD14TFA300FS was qualified as estimated (J).

14E0079 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (0/0), acenaphthylene (0/0), fluorene (35/32), and naphthalene (0/0), which may indicate low bias, and a RPD greater than the laboratory QC limit of 30 for benzo(b)fluoranthene (47). Fluorene was reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Acenaphthene and naphthalene were reported as not detected in all associated samples and were qualified as rejected (R). Acenaphthylene was reported as not detected in all associated samples, except SD14TFE400FS and SD14TFJ400FS, and was qualified as rejected (R). Detections of acenaphthylene in samples SD14TFE400FS and SD14TFJ400FS were qualified as estimated (J). Benzo(b)fluoranthene results in samples were qualified as estimated (J/UJ).

14E0166 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (31) and naphthalene (26/0), which may indicate low bias, and RPDs greater than the laboratory QC limit of 30 for acenaphthene (32) and acenaphthylene (37). Results for acenaphthene and acenaphthylene were qualified as estimated (J/UJ). Naphthalene was reported as not detected in samples SD14TFG500FS, SD14TFK500FS, SD14TFL300FS, and SD14TFL500FS and was qualified as rejected (R). Naphthalene detections in samples SD14TFE600FS, SD14TFF600FS, and SD14TFH500FS were qualified as estimated (J).

14E0237 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for acenaphthene (31) and naphthalene (26/0), which may indicate low bias, and RPDs greater than the laboratory QC limit of 30 for acenaphthene (32) and acenaphthylene (37). Results for acenaphthene and acenaphthylene were qualified as estimated (J/UJ). Naphthalene was reported as not detected in all samples and was qualified as rejected (R).

Data Package Narrative Review

14D0945 – The case narrative noted that the continuing calibration associated with all samples had a percent difference of 32 for pentachlorophenol.

14D1130 – The case narrative noted that the continuing calibration associated with all samples had a percent difference of 80 for pentachlorophenol.

14D1167 – The case narrative noted that the continuing calibration associated with a subset of samples had a percent difference of 32 for pentachlorophenol.

14E0237 – The case narrative noted that the continuing calibration associated with all samples had a percent difference of 79 for pentachlorophenol.

4.0 PCBs

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). All PCBs in sample SD14TFZA4500FS were reported as not detected and were qualified as rejected (R).

Surrogate Recoveries

14D0945 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14OF81400FS (21/12), SD14OF81900FS (18), and SD14OF81300FS (29), which may indicate low bias. All aroclors in samples SD14OF81400FS, SD14OF81900FS, and SD14OF81300FS were reported as not detected, with the exception of aroclor 1268 in sample SD14OF81300FS, and reporting limits were qualified as estimated (UJ). The detection of aroclor 1268 in sample SD14OF81300FS was qualified as estimated (J).

14D1010 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14OF80800FS (27/27) and SD14OF80100FS (27), which may indicate low bias. All aroclors in samples SD14OF80800FS and SD14OF80100FS were reported as not detected, with the exception of aroclor 1260 in sample SD14OF80800FS, and reporting limits were qualified as estimated (UJ). The detection of aroclor 1260 in sample SD14OF80800FS was qualified as estimated (J).

14D1046 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14OF81800FS (29) and SD14TFB100FS (24), which may indicate low bias. All aroclors in samples SD14OF81800FS and SD14TFB100FS were reported as not detected and reporting limits were qualified as estimated (UJ).

14D1167 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14REF0200FS (25), SD14REF0300FS (27), SD14REF1700FS (20), SD14REF1800FS (19), SD14REFUS100FS (21), SD14TFJ200FS (25), SD14TFJ300FS (20), SD14TFA200FS (29), SD14TFA700FS (26), and SD14TFB700FS (18), which may indicate low bias. All aroclors in samples SD14REF0200FS, SD14REF0300FS, SD14REF1700FS, SD14REF1800FS, SD14REFUS100FS, SD14TFJ200FS, SD14TFJ300FS, SD14TFA200FS, SD14TFA700FS, and SD14TFB700FS, with the exception of aroclor 1016 in samples SD14REF1800FS and SD14REFUS100FS, and aroclor 1262 in sample SD14TFJ200FS, were reported as not detected and reporting limits were qualified as estimated (UJ). The detection of aroclor 1016 in samples SD14REF1800FS and SD14REFUS100FS, and the detection of aroclor 1262 in sample SD14TFJ200FS were qualified as estimated (J).

14E0005 – A surrogate recovery was less than the lower QC limit of 30 in sample SD14TFA300FS (28), which may indicate low bias. All aroclors in sample SD14TFA300FS were reported as not detected and reporting limits were qualified as estimated (UJ).

14E0166 – A surrogate recovery was less than the lower QC limit of 30 in samples SD14REF1100FS (26), SD14REF2300FS (23), SD14TFG500FS (24), and SD14TFL500FS (23), which may indicate low bias. All aroclors in samples SD14REF1100FS, SD14REF2300FS, SD14TFG500FS, except aroclor-

1260, and SD14TFL500FS were reported as not detected and reporting limits were qualified as estimated (UJ). The detection of aroclor 1260 in sample SD14TFG500FS was qualified as estimated (J).

Field Duplicate

14D1046 – RPDs between sample SD14TFDE000FS and its field duplicate SD14TFDE000FD were greater than the QC limit of 50 for aroclor 1248 (120) and aroclor 1260 (100). Results for aroclor 1248 and aroclor 1260 in samples SD14TFDE000FS and SD14TFDE000FD were qualified as estimated (J).

MS/MSD

14D0945 – The MS/MSD associated with sample SD14OF81400FS had percent recoveries less than the lower QC limit of 40 for aroclor 1016 (39/28) and aroclor 1260 (32), which may indicate low bias. All aroclors in sample SD14OF81400FS were reported as not detected and reporting limits were qualified as estimated (UJ).

14D1167 – The MS/MSD associated with sample SD14TFF100FS had percent recoveries less than the lower QC limit of 40 for aroclor 1260 (39.6/39), which may indicate low bias. All aroclors in sample SD14TFF100FS were qualified as estimated (J/UJ).

14E0105 – The MS/MSD associated with sample SD14TFD300FS had percent recoveries less than the lower QC limit of 40 for aroclor 1016 (37/35) and aroclor 1260 (35/35), which may indicate low bias. All aroclors in sample SD14TFD300FS were reported as not detected and reporting limits were qualified as estimated (UJ).

14E0166 – The MSD associated with sample SD14TFL500FS had a percent recovery less than the lower QC limit of 40 for aroclor 1260 (39.7), which may indicate low bias. All aroclors in sample SD14TFL500FS were reported as not detected and reporting limits were qualified as estimated (UJ).

5.0 PCB Homologs

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). All PCB homologs in sample SD14TFZA4500FS were reported as not detected and were qualified as rejected (R).

Surrogate Recoveries

14E0005 – A surrogate associated with homologs mono through nona had a recovery that was less than the lower laboratory QC limit of 12 in sample SD14TFB200FS (11), which may indicate low bias. Homologs mono through nona were reported as not detected in sample SD14TFB200FS and reporting limits were qualified as estimated (UJ).

Field Duplicate

14D1046 – The RPD between sample SD14TFDE000FS and its field duplicate SD14TFDE000FD was greater than the QC limit of 50 for dichlorobiphenyls (160). Results for dichlorobiphenyls in samples SD14TFDE000FS and SD14TFDE000FD were qualified as estimated (J).

14D1046 – RPDs between sample SD14OF80200FS and its field duplicate SD14OF80200FD were greater than the QC limit of 50 for pentachlorobiphenyls (71) and heptachlorobiphenyls (84). Results for pentachlorobiphenyls and heptachlorobiphenyls in samples SD14OF80200FS and SD14OF80200FD were qualified as estimated (J).

MS/MSD

14D1046 – The MS/MSD associated with sample SD14TFB100FS and its field duplicate SD14TFB100FD had a RPD greater than the laboratory QC limit of 35 for decachlorobiphenyl (43). Decachlorobiphenyl was reported as not detected in samples SD14TFB100FS and SD14TFB100FD and reporting limits were qualified as estimated (UJ).

14D1130 – The MS/MSD associated with sample SD14TFG400FS did not report percent recoveries for pentachlorobiphenyls and octachlorobiphenyls. The laboratory MS/MSD percent recovery QC limits are 0-200. Pentachlorobiphenyls and octachlorobiphenyls were reported as not detected in sample SD14TFG400FS, and based on professional judgment, reporting limits were qualified as estimated (UJ).

14D1167 – The MS/MSD associated with sample SD14REF0500FS and its field duplicate SD14REF0500FD did not report percent recoveries for pentachlorobiphenyls and octachlorobiphenyls. The laboratory MS/MSD percent recovery QC limits are 0-200. Pentachlorobiphenyls and octachlorobiphenyls were reported as not detected in samples SD14REF0500FS and SD14REF0500FD, and based on professional judgment, reporting limits were qualified as estimated (UJ).

14E0005 – The MS/MSD associated with sample SD14TFA500FS and its field duplicate SD14TFA500FD did not report percent recoveries for pentachlorobiphenyls, heptachlorobiphenyls, and octachlorobiphenyls. The laboratory MS/MSD percent recovery QC limits are 0-200. Pentachlorobiphenyls, heptachlorobiphenyls, and octachlorobiphenyls were reported as not detected in samples SD14TFA500FS and SD14TFA500FD, and based on professional judgment, reporting limits were qualified as estimated (UJ).

6.0 METALS

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). Metals reported as not detected in sample SD14TFZA4500FS were qualified as rejected (R). Metal detections in sample SD14TFZA4500FS were qualified estimated (J).

Data Completeness

14F1203 – Due to a laboratory error, the holding time for mercury was grossly exceeded for samples SD14TFK401FS and SD14TFK401FS. Mercury results were not provided in the laboratory data package but were provided in the laboratory EDD.

Holding Times

14F1203 – Due to a laboratory error, the holding time for mercury was grossly exceeded for samples SD14TFK401FS and SD14TFK401FS. Mercury results (provided in the lab EDD only) were reported as not detected and were qualified as rejected (R).

LCS/LCSD

14D0945 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 120 for antimony (144), which may indicate high bias. The antimony detection in associated sample SD14OF81600FS was qualified as estimated (J).

14D1010 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 120 for antimony (142), which may indicate high bias. The antimony detection in associated sample SD14OF81200FS was qualified as estimated (J).

14D1130 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 120 for antimony (144), which may indicate high bias. The antimony detection in associated sample SD14TFG400FS was qualified as estimated (J).

14D1167 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 120 for antimony (141), which may indicate high bias. The antimony detection in associated sample SD14REF0500FD was qualified as estimated (J).

14E0005 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 120 for antimony (144), which may indicate high bias. The antimony detection in associated sample SD14TFA500FD was qualified as estimated (J).

7.0 TOC

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). The TOC detection in sample SD14TFZA4500FS was qualified as estimated (J).

Data Completeness

14F1203 – Due to a laboratory error, TOC samples SD14TFK401FS and SD14TFK401FS were not analyzed.

8.0 Total Cyanide

Sample Collection and Preservation

14E0005 – The percent solids was less than 30 in sample SD14TFZA4500FS (27). Total cyanide was reported as not detected in sample SD14TFZA4500FS and was qualified as rejected (R).

Data Completeness

14F1203 – Due to a laboratory error, total cyanide samples SD14TFK401FS and SD14TFK401FS were not analyzed.

Holding Times

14D1167 – Samples SD14REF0500FS, SD14REF0500FD, SD14REF0200FS, SD14REF0300FS, SD14REF1700FS, SD14REF1800FS, SD14REFUS100FS, SD14REFUS200FS, SD14TFJ200FS,

SD14TFJ300FS, and SD14TFJ500FS were analyzed 4 to 5 days outside the method holding time. Total cyanide results in these samples were qualified as estimated (J/UJ).

MS/MSD

14D1046 – The MS associated with sample SD14TFDE000FS and its field duplicate SD14TFDE000FD had a percent recovery less than the lower QC limit of 75 for total cyanide (54), which may indicate low bias. Two other MS samples were analyzed in this SDG with acceptable recoveries. Based on professional judgment, total cyanide results in samples SD14TFDE000FS and SD14TFDE000FD only were qualified as estimated (J/UJ).

Notes:

Number listed under method indicates number of target analytes reported.

FS = field sample

FD = field duplicate

TABLE 2
Chemist Review Summary
ABM Ferguson-Williams, SAEP
Stratford, Connecticut

14D0852, 14D0945, 14D1010, 14D1046, 14D1130, 14D1167, 14E0005, 14E0079, 14E0105, 14E0166, 14E0237, and 14F1203

PARAMETER	QC TEST	ANALYTE	SOIL (%R)	SOIL (RPD)
SVOCs/PAHs	Surrogate	Acid Compounds	30 - 130	NA
		Base-Neutral Compounds	30 - 130	NA
	MS/MSD	Acid Compounds	30 - 130	30
		Base-Neutral Compounds	40 - 140	30
	LCS	Acid Compounds	30 - 130	Lab Limits
		Base-Neutral Compounds	40 - 140	Lab Limits
PCBs	Surrogate	All Surrogates	30 - 150	NA
	MS/MSD	All Target Compounds	40 - 140	50
	LCS	All Target Compounds	40 - 140	Lab Limits
PCB Homologs	Surrogate	All Surrogates	Lab Limits	Lab Limits
	MS/MSD	All Target Compounds	Lab Limits	Lab Limits
	LCS	All Target Compounds	Lab Limits	Lab Limits
Metals	MS/MSD	All Metals	75 - 125	35
	LCS	All Metals	80 - 120	Lab Limits
TOC	MS/MSD	TOC	Lab Limits	Lab Limits
	LCS	TOC	Lab Limits	Lab Limits
Total Cyanide	MS/MSD	Total Cyanide	75 - 125	35
	LCS	Total Cyanide	Lab Limits	Lab Limits

Notes:

LCS = Laboratory Control Sample
MS/MSD = Matrix Spike/ Matrix Spike Duplicate
NA = Not Applicable
PAHs = Polynuclear Aromatic Hydrocarbons
PCBs = Polychlorinated Biphenyl
%R = Percent Recovery

QC = Quality Control
RPD = Relative Percent Difference
SVOCs = Semivolatile Organic Compounds
TOC = Total Organic Carbon

2014 1-2 FOOT SEDIMENT SAMPLE CHEMIST REVIEW SUMMARY

Chemist Review Summary
ABM Ferguson-Williams, Stratford Army Engine Plant (SAEP)
Stratford, Connecticut
14H0014, 14H0026, 14H0031, 14H0038, 14H0043, 14H0121, 14I0271, and 14I0864

1.0 INTRODUCTION

Ninety sediment samples were collected in April 2014 and May 2014 at SAEP located in Stratford, Connecticut. Samples were analyzed by YORK Analytical Laboratories, Inc (YORK) of Stratford, Connecticut. The following U.S. Environmental Protection Agency (USEPA) analytical methods (USEPA, 1996a) were performed:

- Semivolatile Organic Compounds (SVOCs) by USEPA Method 8270D
- Polynuclear Aromatic Hydrocarbons (PAHs) by USEPA Method 8270 Selective Ion Monitoring (SIM)
- Polychlorinated Biphenyls (PCBs) by USEPA Method 8082A
- PCBs Homologs by Modified EPA Method 680
- Metals by USEPA Methods 6020A
- Total Organic Carbon (TOC) by Method Lloyd Kahn
- Total Cyanide by USEPA Methods 9014/9010C

A chemist review was completed for all analyses to evaluate data quality in support of the Connecticut Department of Energy and Environmental Protection Recommended Reasonable Confidence Protocols (RCPs) [CTDEEP, 2010a; CTDEEP, 2010b]. Samples included in this data evaluation are presented in Table 1. Data quality evaluations were completed using quality control (QC) limits specified by the CTDEEP RCPs and the subcontract laboratory presented in Table 2. If data quality issues were identified during the review, results were qualified in the final data set and interpretations on data biases provided. Data qualifications were completed using the professional judgment of the validation chemist and general procedures specified in Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996b).

Data qualifications were completed if necessary in accordance with the guidelines or the professional judgment of the project chemist using the following qualifiers:

- J = The reported concentration is considered an estimated value
- U = The target compound was not detected above the reporting limit (RL)
- UJ = The target compound was not detected and the RL is considered to be estimated
- R = The reported value is rejected and considered to be unusable

Validation reason codes were applied to results associated with QC measurements outside project QC goals. The validation qualification actions and associated validation reason codes applied to sample results are summarized on Table 3. The following data validation reason codes were applied to one or more sample results:

- FD = Field duplicate relative percent difference (RPD) limit exceeded
- HT = Holding time exceeded
- LCS-H = Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) recovery high
- LCS-L = LCS/LCSD recovery low
- LCS-RPD = LCS/LCSD RPD limit exceeded
- MS-H = Matrix Spike/Matrix Spike Duplicate (MS/MSD) recovery high

MS-L = MS/MSD recovery low
MS-RPD = MS/MSD RPD limit exceeded
PM = Percent moisture exceeds EPA guideline
SS-L = Surrogate recovery low

A complete summary of final sample results is provided in Table 4.

Data were evaluated based on the following parameters where applicable:

- Sample Collection and Preservation
- Data Completeness
- Holding Times
- Surrogate Recoveries
- * Blank Contamination
- Field Duplicates
- LCS/LCSD
- MS/MSD
- * Reporting Limits (RLs)
- Data Package Narrative Review

* - all criteria were met for this parameter

In addition to the above QC evaluations performed as part of the chemist review, any issues with instrument calibration and target compound quantitation noted in the lab data package narratives are summarized in this report. A review of these QC parameters is outside the scope of the chemist review and data qualifiers are not applied for these issues.

A subset of samples was analyzed at dilution due to high target compound concentrations and/or matrix interference. Reporting limits for non-detect results are elevated.

All samples were collected in April 2014 and May 2014, were frozen with 48 hours of collection, and were placed on hold at the laboratory. Samples were taken off hold and analyzed in August 2014. Freezing of the samples allowed for extended holding times for up to one year for SVOCs, PAHS, PCBs, and PCB homologs. Metals samples remained with the 6 month holding time. There are no guidelines that extend the holding times for total cyanide or TOC analyses by freezing.

With the exception of the following items discussed below, results were determined to be usable as reported by the laboratory.

2.0 SVOCs

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). All SVOCs in sample SD14OF80901FS were reported as not detected and were qualified as rejected (R).

Data Completeness

14I0271 – Due to a laboratory error, SVOC samples SD14TFK401FS and SD14TFL401FS were not analyzed.

Surrogate Recoveries

14H0121 – Surrogates associated with base-neutral compounds had recoveries that were less than the lower QC limit of 30 in samples SD14TFZA6701FS (25/26), SD14TFB401FS (27/24), SD14TFA401FS (22/18), and SD14OF81401FS (29/29), which may indicate low bias. All base-neutral compounds in samples SD14TFZA6701FS, SD14TFB401FS, SD14TFA401FS, and SD14OF81401FS were reported as not detected and reporting limits were qualified as estimated (UJ).

Field Duplicate

14H0038 – The RPD between sample SD14OF80201FS and its field duplicate SD14OF80201FD was greater than the QC limit of 50 for bis(2-ethylhexyl)phthalate (200). Results for bis(2-ethylhexyl)phthalate in samples SD14OF80201FS and SD14OF80201FD were qualified as estimated (J/UJ).

LCS/LCSD

14H0014 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for aniline (34), 4-chloroaniline (34), hexachlorobenzene (38), hexachlorocyclopentadiene (21), and isophorone (39), and percent recoveries less than the lower QC limit of 30 for 2,4-dinitrophenol (26) and 4-nitrophenol (24), which may indicate low bias. Aniline, 4-chloroaniline, hexachlorobenzene, hexachlorocyclopentadiene, isophorone, 2,4-dinitrophenol, and 4-nitrophenol were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Some compounds in samples SD14TFDE001FS and SD14TFDE001FD were rejected due to low MS/MSD recoveries.

14H0026 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for hexachlorocyclopentadiene (18), and percent recoveries less than the lower QC limit of 30 for 2,4-dinitrophenol (27), which may indicate low bias. Hexachlorocyclopentadiene and 2,4-dinitrophenol were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). Hexachlorocyclopentadiene and 2,4-dinitrophenol were subsequently rejected in samples SD14TFA501FS and SD14TFA501FD due to low MS/MSD recovery.

14H0031 – The LCS associated with all samples had a percent recovery less than the lower QC limit of 40 for hexachlorocyclopentadiene (33), which may indicate low bias. Hexachlorocyclopentadiene was reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ).

14H0038 – The LCS associated with all samples had a percent recovery less than the lower QC limit of 40 for hexachlorocyclopentadiene (29), which may indicate low bias. Hexachlorocyclopentadiene was reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ). All SVOCs in sample SD14OF80901FS were qualified as rejected (R) due to low percent solids. Hexachlorocyclopentadiene in samples SD14OF80201FS and SD14OF80201FD was rejected due to low MS/MSD recoveries.

14H0043 – The LCS associated with samples SD14TFC101FS and SD14TFF501FS had a percent recovery less than the lower QC limit of 40 for hexachlorocyclopentadiene (18) and had a percent recovery less than the lower QC limit of 30 for 2,4-dinitrophenol (27), which may indicate low bias. Hexachlorocyclopentadiene and 2,4-dinitrophenol were reported as not detected in samples SD14TFC101FS and SD14TFF501FS and reporting limits were qualified as estimated (UJ).

14H0043 – The LCS associated with a subset of samples had percent recoveries less than the lower QC limit of 40 for benzyl butyl phthalate (34), 4-chloroaniline (36), bis(2-ethylhexyl)phthalate (39), and hexachlorocyclopentadiene (10) and had a percent recovery less than the lower QC limit of 30 for 2,4-dinitrophenol (25), which may indicate low bias. Benzyl butyl phthalate, 4-chloroaniline, bis(2-ethylhexyl)phthalate, hexachlorocyclopentadiene, and 2,4-dinitrophenol were reported as not detected in associated samples SD14TFF401FS, SD14TFE401FS, SD14TFE501FS, SD14TFE301FS, SD14TFD501FS, SD14TFH301FS, SD14TFK301FS, SD14TFJ401FS, and SD14TFH401FS, and reporting limits were qualified as estimated (UJ). 2,4-Dinitrophenol in sample SD14TFE501FS was rejected due to low MS/MSD recoveries.

14H0121 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for benzyl butyl phthalate (34), 4-chloroaniline (36), bis(2-ethylhexyl)phthalate (39), and hexachlorocyclopentadiene (10) and had a percent recovery less than the lower QC limit of 30 for 2,4-dinitrophenol (25), which may indicate low bias. Benzyl butyl phthalate, 4-chloroaniline, bis(2-ethylhexyl)phthalate, hexachlorocyclopentadiene, and 2,4-dinitrophenol were reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ).

14I0864 – The LCS associated with all samples had a percent recovery less than the lower QC limit of 40 for pyridine (38), which may indicate low bias. Pyridine was reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ).

MS/MSD

14H0014 – The MS/MSD associated with sample SD14TFDE001FS and its field duplicate SD14TFDE001FD had several percent recoveries of zero for some base-neutral compounds and acid compounds, and a percent recovery less than the QC limit of 30 for phenol (29), which may indicate low bias. All compounds in samples SD14TFDE001FS and SD14TFDE001FD were reported as not detected. Compounds reported as not detected in samples SD14TFDE001FS and SD14TFDE001FD with percent recoveries less than 10 were qualified as rejected (R). Phenol was reported as not detected in samples SD14TFDE001FS and SD14TFDE001FD (UJ) and was qualified as estimated (UJ).

14H0026 – The MS/MSD associated with sample SD14TFA501FS and its field duplicate SD14TFA501FD had percent recoveries less than the lower QC limit of 40 for base-neutral compounds hexachlorocyclopentadiene (0/0) and hexachloroethane (8/9), and percent recoveries less than the lower QC limit of 30 for acid compounds 4,6-dinitro-2-methylphenol (0/0), 2,4-dinitrophenol (0/0), 4-nitrophenol (19/15), and pentachlorophenol (19/11), which may indicate low bias, and a RPD greater than the QC limit of 30 for pentachlorophenol (54). Hexachlorocyclopentadiene, hexachloroethane, 4,6-dinitro-2-methylphenol, and 2,4-dinitrophenol were reported as not detected in samples SD14TFA501FS and SD14TFA501FD and were qualified as rejected (R). 4-Nitrophenol and pentachlorophenol were reported as not detected in samples SD14TFA501FS and SD14TFA501FD and reporting limits were qualified as qualified as estimated (UJ).

14H0031 – The MS/MSD associated with sample SD14TFB101FS and its field duplicate SD14TFB101FD had percent recoveries less than the lower QC limit of 40 for base-neutral compounds di-n-octyl phthalate (37), bis(2-ethylhexyl)phthalate (35), hexachlorocyclopentadiene (10/10), hexachloroethane (19/16), and hexachlorobenzene (38), which may indicate low bias. Di-n-octyl phthalate, bis(2-ethylhexyl)phthalate, hexachlorocyclopentadiene, hexachloroethane, and hexachlorobenzene were reported as not detected in samples SD14TFB101FS and SD14TFB101FD and reporting limits were qualified as estimated (UJ).

14H0038 – The MS/MSD associated with sample SD14OF80201FS and its field duplicate SD14OF80201FD had percent recoveries less than the lower QC limit of 40 for base-neutral compounds hexachlorocyclopentadiene (0/0), hexachloroethane (0/0), pentachloronitrobenzene (0/0), and pyridine (36/37) and percent recoveries less than the lower QC limit of 30 for acid compounds 4,6-dinitro-2-methylphenol (0/0), 2,4-dinitrophenol (0/0), 2-nitrophenol (23/26), 4-nitrophenol (0/0), and pentachlorophenol (0/0), which may indicate low bias, and a RPD greater than the QC limit of 30 for hexachlorobenzene (32). Hexachlorocyclopentadiene, hexachloroethane, pentachloronitrobenzene, 4,6-dinitro-2-methylphenol, 2,4-dinitrophenol, 4-nitrophenol, and pentachlorophenol were reported as not detected in samples SD14OF80201FS and SD14OF80201FD and were qualified as rejected (R). Hexachlorobenzene pyridine, and 2-nitrophenol were reported as not detected in samples SD14OF80201FS and SD14OF80201FD and reporting limits were qualified as estimated (UJ).

14H0043 – The MS/MSD associated with sample SD14TFE501FS had percent recoveries less than the lower QC limit of 40 for base-neutral compounds hexachlorocyclopentadiene (12/13) and hexachloroethane (39.5) and percent recoveries less than the lower QC limit of 30 for acid compound 2,4-dinitrophenol (0/26), which may indicate low bias, and RPDs greater than the QC limit of 30 for bis(2-chloroethyl)ether (31), hexachloroethane (38), and pyridine (41). 2,4-Dinitrophenol was reported as not detected in sample SD14TFE501FS and was qualified as rejected (R). Hexachlorocyclopentadiene, hexachloroethane, bis(2-chloroethyl)ether, 2,4-dinitrophenol, and pyridine were reported as not detected in sample SD14TFE501FS and reporting limits were qualified as estimated (UJ).

Data Package Narrative Review

14H0014 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X had percent differences of 33 for N-nitroso-di-n-propylamine, 53 for 2,4-dinitrophenol, and 39 for hexachlorobenzene.

14H0014 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 4X had percent differences of 44 for 4-chloroaniline, 34 for hexachlorocyclopentadiene, 44 for 2,4-dinitrophenol, 34 for hexachlorobenzene, 30 for butyl benzyl phthalate, and 33 for bis(2-ethylhexyl)phthalate.

14H0026 – The case narrative noted that the continuing calibration associated with a subset of samples had percent differences of -45 for bis(2-chloroisopropyl)ether, 41 for hexachlorocyclopentadiene, 88 for 2,4-dinitrophenol, 69 for 4,6-dinitro-2-methylphenol, and 31 for butyl benzyl phthalate.

14H0026 – The case narrative noted that the continuing calibration associated with a subset of samples had percent differences of -56 for bis(2-chloroisopropyl)ether, 43 for hexachlorocyclopentadiene, 40 for 2,4-dinitrophenol, 45 for 4-nitrophenol, and 32 for hexachlorobenzene.

14H0026 – The case narrative noted that internal standards chrysene-d12 and perylene-d12 were outside the acceptance criteria in samples SD14OF80701FS, SD14OF80101FS, and SD14OF80401FS.

14H0031 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X had percent differences of -46 for 2,4-dichlorophenol, -55 for 1,2,4-trichlorobenzene, -62 for hexachlorobutadiene, -38 for 1,2,4,5-tetrachlorobenzene, 45 for hexachlorocyclopentadiene, 45 for 2,4-dinitrophenol, -33 for 4-bromophenyl phenyl ether, -36 for pentachlorophenol, 32 for butyl benzyl phthalate, and 35 for bis(2-ethylhexyl)phthalate.

14H0031 – The case narrative noted that the continuing calibration associated with sample SD14TFB101FS analyzed at 4X had percent differences of -42 for bis(2-chloroisopropyl ether), 46 for 4-chloroaniline, 64 for hexachlorocyclopentadiene, 47 for 2,4-dinitrophenol, 32 for butyl benzyl phthalate, and 38 for 3,3'-dichlorobenzidine.

14H0031 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X had percent differences of -40 for 2,4-dichlorophenol, -41 for 1,2,4-trichlorobenzene, -53 for hexachlorobutadiene, 37 for hexachlorocyclopentadiene, 42 for hexachlorobenzene, 35 for butyl benzyl phthalate, and 42 for bis(2-ethylhexyl)phthalate.

14H0038 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 4X had percent differences of -52 for bis(2-chloroisopropyl ether), 52 for hexachlorocyclopentadiene, 68 for 2,4-dinitrophenol, 42 for 4,6-dinitro-2-methylphenol, and 31 for bis(2-ethylhexyl)phthalate.

14H0038 – The case narrative noted that the continuing calibration associated with all samples analyzed at 1X had percent differences of -52 for bis(2-chloroisopropyl ether), 66 for 2,4-dinitrophenol, 42 for 4,6-dinitro-2-methylphenol, 31 for bis(2-ethylhexyl)phthalate.

14H0038 – The case narrative noted that internal standards chrysene-d12 and perylene-d12 were outside the acceptance criteria in samples SD14OF80201FD, SD14OF80501FS, and SD14OF80601FS.

14H0043 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X had percent differences of -47 for bis(2-chloroisopropyl ether), 41 for 4-chloroaniline, 31 for hexachlorobenzene, 31 for butyl benzyl phthalate, and 32 for 3,3'-dichlorobenzidine.

14H0043 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X had percent differences of -66 for bis(2-chloroisopropyl ether), 36 for hexachlorocyclopentadiene, 61 for 2,4-dinitrophenol, and 30.4 for bis(2-ethylhexyl)phthalate.

14H0043 – The case narrative noted that internal standard perylene-d12 were outside the acceptance criteria in sample SD14TFC101FS.

14H0121 – The case narrative noted that the continuing calibration associated with a subset of samples analyzed at 1X had percent differences of -66 for bis(2-chloroisopropyl ether), 36 for hexachlorocyclopentadiene, 61 for 2,4-dinitrophenol, and 30.4 for bis(2-ethylhexyl)phthalate.

14I0864 – The case narrative noted that the continuing calibration associated with all samples had a percent difference of 73 for pyridine.

3.0 PAHs

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). PAHs reported as not detected in sample SD14OF80901FS were qualified as rejected (R). PAH detections in sample SD14OF80901FS were qualified estimated (J).

Data Completeness

14I0271 – Due to a laboratory error, PAH samples SD14TFK401FS and SD14TFL401FS were not analyzed.

Field Duplicates

14H0026 – RPDs between sample SD14TFA501FS and its field duplicate SD14TFA501FD were greater than the QC limit of 50 for acenaphthylene (200), benzo(b)fluoranthene (77), and phenanthrene (84). Results for acenaphthylene, benzo(a)anthracene, and phenanthrene in samples SD14TFA501FS and SD14TFA501FD were qualified as estimated (J/UJ).

14H0031 – RPDs between sample SD14TFB101FS and its field duplicate SD14TFB101FD were greater than the QC limit of 50 for all PAHs, except naphthalene. All PAHs, except naphthalene, in samples SD14TFB101FS and SD14TFB101FD were qualified as estimated (J/UJ).

14H0038 – RPDs between sample SD14OF80201FS and its field duplicate SD14OF80201FD were greater than the QC limit of 50 for benzo(b)fluoranthene (64) and dibenz(a,h)anthracene (200). Results for benzo(b)fluoranthene and dibenz(a,h)anthracene in samples SD14OF80201FS and SD14OF80201FD were qualified as estimated (J/UJ).

LCS/LCSD

14H0043 – The LCS/LCSD associated with a subset of samples had a RPD greater than the laboratory QC limit of 30 for naphthalene (60). Naphthalene was reported as not detected in associated samples SD14TFF401FS, SD14TFE401FS, SD14TFE501FS, SD14TFE301FS, SD14TFD501FS, SD14TFH301FS, SD14TFK301FS, SD14TFJ401FS, and SD14TFH401FS and reporting limits were qualified as estimated (UJ).

14H0121 – The LCS/LCSD associated with all samples had a RPD greater than the laboratory QC limit of 30 for naphthalene (60). Naphthalene was reported as not detected in all associated samples and reporting limits were qualified as estimated (UJ).

Data Package Narrative Review

14H0031 – The case narrative noted that the continuing calibration associated with a subset of samples had a percent difference of 35 for dibenz(a,h)anthracene.

4.0 PCBs

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). All PCBs in sample SD14OF80901FS were reported as not detected and were qualified as rejected (R).

Data Completeness

14I0271 – Due to a laboratory error, PCB samples SD14TFK401FS and SD14TFL401FS were not analyzed.

Surrogate Recoveries

14H0026 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14TFZA5601FS (23/17), SD14TFZA4501FS (20/15), SD14TFB701FS (17/14), SD14TFA501FS (19), SD14TFA501FD (28/18), SD14TFA601FS (18/17), SD14TFC701FS (23), SD14TFK201FS (17), SD14OF81201FS (19), SD14OF81101FS (28), SD14OF80801FS (21), SD14OF80701FS (23), SD14OF80101FS (27), SD14OF80301FS (25/19), and SD14OF80401FS (23), which may indicate low bias. All aroclors in all samples were reported as not detected, with the exception of aroclor 1254 and aroclor 1260 in samples SD14OF80101FS and SD14OF80701FS and reporting limits were qualified as estimated (UJ). The detections of aroclor 1254 and aroclor 1260 in samples SD14OF80101FS and SD14OF80701FS were qualified as estimated (J).

14H0031 – A surrogate recovery was less than the lower QC limit of 30 in sample SD14TFD401FS (28), which may indicate low bias. All aroclors in sample SD14TFD401FS were reported as not detected and reporting limits were qualified as estimated (UJ).

14H0038 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14OF80201FD (27), SD14OF80901FS (15/17), SD14TFJ201FS (18/14), SD14TFJ301FS (19/15), SD14TFJ501FS (24/19), SD14TFG301FS (23/13), SD14TFG201FS (15/9), SD14TFG101FS (27/21), SD14TFF101FS (21/15), and SD14TFA201FS (18/13), which may indicate low bias. All aroclors were reported as not detected in samples and reporting limits were qualified as estimated (UJ), with the exception of sample SD14TFG201FS. All aroclors were reported as not detected in sample SD14TFG201FS and were qualified as rejected (R). All PCBs in sample SD14OF80901FS were qualified as rejected (R) due to low percent solids.

14H0043 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14TFE301FS (27/24) and SD14TFK301FS (23), which may indicate low bias. All aroclors were reported as not detected in these samples and reporting limits were qualified as estimated (UJ).

14H0121 – Surrogate recoveries were less than the lower QC limit of 30 in samples SD14TFE101FS (19), SD14TFA301FS (28/21), SD14TFZA6701FS (20/20), SD14TFA401FS (19/15), SD14OF81701FS (26/21), SD14OF81601FS (23/16), SD14OF81401FS (22), and SD14OF81901FS (23), which may indicate low bias. All aroclors were reported as not detected in all samples, except aroclor 1268 in sample SD14OF81901FS, and reporting limits were qualified as estimated (UJ). The detection of aroclor 1268 in sample SD14OF81901FS was qualified as estimated (J).

Field Duplicate

14H0031 – The RPD between sample SD14TFB101FS and its field duplicate SD14TFB101FD was greater than the QC limit of 50 for aroclor 1248 (200). Results for aroclor 1248 in samples SD14TFB101FS and SD14TFB101FD were qualified as estimated (J/UJ).

LCS/LCSD

14H0121 – The LCS/LCSD associated with all samples had RPDs greater than the QC limit of 25 for aroclor 1016 (33) and aroclor 1260 (36). All aroclors were reported as not detected in all samples, except aroclor 1268 in sample SD14OF81901FS, and reporting limits were qualified as estimated (UJ). The detection of aroclor 1268 in sample SD14OF81901FS was qualified as estimated (J).

MS/MSD

14H0026 – The MSD associated with sample SD14TFA501FS and its field duplicate SD14TFA501FD had percent recoveries less than the lower QC limit of 40 for aroclor 1016 (23) and 1260 (19), which may indicate low bias, and RPDs greater than the QC limit of 50 for 1016 (74) and 1260 (75). All aroclors in samples SD14TFA501FS and SD14TFA501FD were reported as not detected and reporting limits were qualified as estimated (UJ).

14H0038 – The MSD associated with sample SD14OF80201FS and its field duplicate SD14OF80201FD had a percent recovery less than the lower QC limit of 40 for 1260 (34), which may indicate low bias. All aroclors in samples SD14OF80201FS and SD14OF80201FD were reported as not detected and reporting limits were qualified as estimated (UJ).

5.0 PCB Homologs

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). All PCBs in sample SD14OF80901FS were reported as not detected and were qualified as rejected (R).

Data Completeness

14I0271 – Due to a laboratory error, PCB homolog samples SD14TFK401FS and SD14TFL401FS were not analyzed.

Field Duplicate

14H0014 – RPDs between sample SD14TFDE001FS and its field duplicate SD14TFDE001FD were greater than the QC limit of 50 for trichlorobiphenyls (180), tetrachlorobiphenyls (150), pentachlorobiphenyls (140), hexachlorobiphenyls (200), and heptachlorobiphenyls (200). Results for trichlorobiphenyls, tetrachlorobiphenyls, pentachlorobiphenyls, hexachlorobiphenyls, and heptachlorobiphenyls in samples SD14TFDE001FS and SD14TFDE001FD were qualified as estimated (J/UJ).

14H0031– The RPD between sample SD14TFB101FS and its field duplicate SD14TFB101FD was greater than the QC limit of 50 for heptachlorobiphenyls (200). Results for heptachlorobiphenyls in samples SD14TFB101FS and SD14TFB101FD were qualified as estimated (J/UJ).

MS/MSD

14H0014 – The MS/MSD associated with sample SD14TFDE001FS and its field duplicate SD14TFDE001FD had percent recoveries greater than the upper QC limit of 115 for trichlorobiphenyls (721/520), tetrachlorobiphenyls (509/281), pentachlorobiphenyls (668/423), hexachlorobiphenyls (158), and heptachlorobiphenyls (179/195), which may indicate high bias, and RPDs outside the QC limit of 35 for dichlorobiphenyls (45), tetrachlorobiphenyls (48), pentachlorobiphenyls (35.3), hexachlorobiphenyls (48), and octachlorobiphenyls (35.6). Trichlorobiphenyls, tetrachlorobiphenyls, pentachlorobiphenyls, hexachlorobiphenyls, heptachlorobiphenyls, dichlorobiphenyls, and octachlorobiphenyls results in samples SD14TFDE001FS and SD14TFDE001FD were qualified as estimated (J/UJ).

14H0026 – The MS/MSD associated with sample SD14TFA501FS and its field duplicate SD14TFA501FD had RPDs outside the QC limit of 35 for pentachlorobiphenyls (45), hexachlorobiphenyls (36), and octachlorobiphenyls (45). Pentachlorobiphenyls, hexachlorobiphenyls, and octachlorobiphenyls

were reported as not detected in samples SD14TFA501FS and SD14TFA501FD and reporting limits were qualified as estimated (UJ).

14H0031 – The MS/MSD associated with sample SD14TFB101FS and its field duplicate SD14TFB101FD did not report percent recoveries for tetrachlorobiphenyls and had percent recoveries greater than the QC limit of 115 for pentachlorobiphenyls (154/165). Detections of tetrachlorobiphenyls and pentachlorobiphenyls in samples SD14TFB101FS and SD14TFB101FD were qualified as estimated (J).

6.0 METALS

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). Metals reported as not detected in sample SD14OF80901FS were qualified as rejected (R). Metals detections in sample SD14OF80901FS were qualified estimated (J).

Field Duplicates

14H0026 – RPDs between sample SD14TFA501FS and its field duplicate SD14TFA501FD were greater than the QC limit of 50 for chromium (82), copper (100), and zinc (82). Based on professional judgment, detections of chromium, copper, and zinc in samples SD14TFA501FS and SD14TFA501FD only were qualified as estimated (J).

14H0031 – RPDs between sample SD14TFB101FS and its field duplicate SD14TFB101FD were greater than the QC limit of 50 for chromium (52), copper (80), lead (53), manganese (77), silver (56), and zinc (69). Based on professional judgment, detections of chromium, copper, lead, manganese, silver, and zinc in samples SD14TFB101FS and SD14TFB101FD only were qualified as estimated (J).

14H0038 – RPDs between sample SD14OF80201FS and its field duplicate SD14OF80201FD were greater than the QC limit of 50 for arsenic (120), chromium (150), copper (140), lead (100), manganese (77), nickel (130), and zinc (110). Based on professional judgment, detections of arsenic, chromium, copper, lead, manganese, nickel, and zinc in samples SD14OF80201FS and SD14OF80201FD only were qualified as estimated (J).

LCS/LCSD

14H0031 – The LCS associated with all samples had a percent recovery less than the lower QC limit of 80 for zinc (79), which may indicate low bias. Zinc was detected in all associated samples and results were qualified as estimated (J).

14H0043 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 120 for antimony (147), which may indicate high bias. The antimony detection in associated sample SD14TFF501FS was qualified as estimated (J).

7.0 TOC

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). The TOC detection in sample SD14OF80901FS was qualified as estimated (J).

Data Completeness

14I0271 – Due to a laboratory error, TOC samples SD14TFK401FS and SD14TFL401FS were not analyzed.

Holding Times

All samples were collected in April 2014 and May 2014, were frozen with 48 hours of collection, and were placed on hold at the laboratory. Samples were taken off hold and analyzed in August 2014. There are no guidelines that extend the holding time for TOC analysis by freezing. TOC was reported as detected in all samples and results were qualified as estimated (J).

Field Duplicates

14H0031 – The RPD between sample SD14TFB101FS and its field duplicate SD14TFB101FD was greater than the QC limit of 50 for TOC (67). Based on professional judgment, detections of TOC in samples SD14TFB101FS and SD14TFB101FD only were qualified as estimated (J).

14H0038 – The RPD between sample SD14OF80201FS and its field duplicate SD14OF80201FD was greater than the QC limit of 50 for TOC (88). Based on professional judgment, detections of TOC in samples SD14OF80201FS and SD14OF80201FD only were qualified as estimated (J).

8.0 Total Cyanide

Sample Collection and Preservation

14H0038 – The percent solids was less than 30 in sample SD14OF80901FS (29). The cyanide detection in sample SD14OF80901FS was qualified as estimated (J).

Data Completeness

14I0271 – Due to a laboratory error, total cyanide samples SD14TFK401FS and SD14TFL401FS were not analyzed.

Holding Times

All samples were collected in April 2014 and May 2014, were frozen with 48 hours of collection, and were placed on hold at the laboratory. Samples were taken off hold and analyzed in August 2014. There are no guidelines that extend the holding time for total cyanide analysis by freezing. All cyanide results were qualified as estimated (J/UJ).

2015 SEDIMENT SAMPLE CHEMIST REVIEW SUMMARY

**Chemist Review Summary
April 2015 Sediment Samples – Tidal Flats and Outfall 008
Stratford Army Engine Plant (SAEP)
Stratford, Connecticut**

1.0 INTRODUCTION

Sediment samples were collected in April 2015 at SAEP located in Stratford, Connecticut. Samples were analyzed by EnviroSystems, Inc. (ESI) located in Hampton, New Hampshire. The following U.S. Environmental Protection Agency (USEPA) analytical methods (USEPA, 1996a) were performed:

- J Polynuclear Aromatic Hydrocarbons (PAHs) by USEPA Method 8270 Selective Ion Monitoring (SIM)
- J Polychlorinated Biphenyls (PCBs) by USEPA Method 8082A
- J PCB Homologs by Modified EPA Method 8270SIM
- J PCB Congeners by Modified EPA Method 8270/680
- J Metals by USEPA Methods 6020A
- J Total Organic Carbon (TOC) by Method Lloyd Kahn

A chemist review was completed for all analyses to evaluate data quality in support of the Connecticut Department of Energy and Environmental Protection Recommended Reasonable Confidence Protocols (RCPs) [CTDEEP, 2010a; CTDEEP, 2010b]. Samples included in this data evaluation are presented in Table 1. Data quality evaluations were completed using quality control (QC) limits specified by the CTDEEP RCPs and the subcontract laboratory presented in Table 2. If data quality issues were identified during the review, results were qualified in the final data set and interpretations on data biases provided. Data qualifications were completed using the professional judgment of the validation chemist and general procedures specified in Region I EPA-New England Data Validation Functional Guidelines for Evaluating Environmental Analyses (USEPA, 1996b).

Data qualifications were completed if necessary in accordance with the guidelines or the professional judgment of the project chemist using the following qualifiers:

- J = The reported concentration is considered an estimated value
- U = The target compound was not detected above the reporting limit (RL)
- UJ = The target compound was not detected and the RL is considered to be estimated

Validation reason codes were applied to results associated with QC measurements outside project QC goals. The validation qualification actions and associated validation reason codes applied to sample results are summarized on Table 3. The following data validation reason codes were applied to one or more sample results:

- BL1 = Method blank qualifier
- LCS-H = Laboratory control sample/laboratory control sample duplicate (LCS/LCSD) recovery high
- LCS-L = LCS/LCSD recovery low
- LCS-RPD = LCS/LCSD RPD limit exceeded
- LD = Laboratory duplicate relative percent difference (RPD) limit exceeded
- MS-H = Matrix spike/matrix spike duplicate (MS/MSD) recovery high
- MS-L = MS/MSD recovery low
- MS-RPD = MS/MSD RPD limit exceeded

SS-H = Surrogate recovery high

A complete summary of final sample results is provided in Table 4.

Data were evaluated based on the following parameters where applicable:

- * Sample Collection and Preservation
- * Data Completeness
- * Holding Times
- Surrogate Recoveries
- Blank Contamination
- Laboratory Duplicates
- LCS/LCSD
- Standard Reference Material (SRM)
- MS/MSD
- * Reporting Limits (RLs)
- Data Package Narrative Review

* - all criteria were met for this parameter

In addition to the above QC evaluations performed as part of the chemist review, any issues with instrument calibration and target compound quantitation noted in the lab data package narratives are summarized in this report. A review of these QC parameters is outside the scope of the chemist review and data qualifiers are not applied for these issues.

A subset of samples was analyzed at dilution due to high target compound concentrations and/or matrix interference. Reporting limits for non-detect results are elevated.

The following samples had percent solids less than the EPA recommendation of 30%: SD14OF0302FS, SD14OF0303FS, SD14OF1002FS, SD14OF1203FSH, and SD14OF0403FSH. The laboratory increased sample amount to compensate for the low solids and based on professional judgement, no action was taken.

With the exception of the following items discussed below, results were determined to be usable as reported by the laboratory.

2.0 PAHs

Blank Contamination

SDG_03 - A method blank associated with a subset of samples had a blank detection for phenanthrene at 6 ug/Kg. An action limit was established at five times the blank concentration. Low level detections of phenanthrene in samples SD14TFC202FS, SD14TFA202FS, SD15TFGH702FS, SD15TFK601FS, and SD14TFG102FS were qualified as not detected at the reporting limit (U).

SDG_05H - A method blank associated with a subset of samples had a blank detection for phenanthrene at 20 ug/Kg. An action limit was established at five times the blank concentration. Low level detections of phenanthrene in samples SD14OF1803FSH, SD14OF1103FSH, SD14OF0603FSH, and SD14TFG503FSH were qualified as not detected at the reporting limit (U).

SRM

SDG_05H – The SRM associated with all samples had a percent recovery less than the lower QC limit of 40 for naphthalene (33), which may indicate low bias. Positive and non-detect results for naphthalene in all samples were qualified as estimated (J/UJ).

3.0 PCBs

Lab Duplicate

SDG_07 – Sample SD14OF0502FS and its laboratory duplicate had a detection and non-detection for Aroclor-1262. The result for Aroclor-1262 in sample SD14OF0502FS was qualified as estimated (J).

SDG_12 – Sample SD15TFGH1203FS and its laboratory duplicate had a detection and non-detection for Aroclor-1248. The result for Aroclor-1248 in sample SD15TFGH1203FS was qualified as estimated (J).

MS/MSD

SDG_17H – The MS/MSD associated with sample SD14OF1003FSH had percent recoveries less than the lower QC limit of 40 for Aroclor-1260 (0/0), which may indicate low bias. Aroclor-1260 was detected in sample SD14OF1003FSH and the result was qualified estimated (J).

4.0 PCB Homologs

Laboratory Duplicate

SDG_10 – Sample SD14TFGH103FS and its laboratory duplicate had a detection and non-detection for hexachlorobiphenyl. The result for hexachlorobiphenyl in sample SD14TFGH103FS was qualified as estimated (J).

SDG_17H – Sample SD14OF1003FSH and its laboratory duplicate had a detection and non-detection for dichlorobiphenyl and an RPD greater than the QC limit of 50 for decachlorobiphenyl (83). Dichlorobiphenyl was not detected in sample SD14OF1003FSH and the reporting limit was qualified as estimated (UJ) and the detection for decachlorobiphenyl was qualified as estimated (J).

LCS/LCSD

SDG_10 – The LCS associated with all samples had percent recoveries less than the lower QC limit of 40 for monochlorobiphenyl (38) and pentachlorobiphenyl (37), which may indicate low bias. Monochlorobiphenyl and pentachlorobiphenyl results in all samples were qualified as estimated (J/UJ).

SDG_12 – The LCS/LCSD associated with all samples had percent recoveries less than the lower QC limit of 40 for monochlorobiphenyl (37), dichlorobiphenyl (37), trichlorobiphenyl (33), and pentachlorobiphenyl (34), which may indicate low bias. Monochlorobiphenyl, dichlorobiphenyl, trichlorobiphenyl, and pentachlorobiphenyl results in all samples were qualified as estimated (J/UJ).

SDG_16H – The LCS associated with all samples had a percent recovery less than the lower QC limit of 40 for pentachlorobiphenyl (32), which may indicate low bias. Pentachlorobiphenyl results in all samples were qualified as estimated (J/UJ).

SDG_17H – The LCS/LCSD associated with all samples had an RPD for monochlorobiphenyl (53) that was greater than the QC limit of 30. Results for monochlorobiphenyl in all samples were qualified as estimated (J/UJ).

MS/MSD

SDG_10 – The MS/MSD associated with sample SD14TFGH103FS had percent recoveries less than the lower QC limit of 40 for monochlorobiphenyl (39/39) and pentachlorobiphenyl (39/37), which may indicate low bias. Monochlorobiphenyl and pentachlorobiphenyl were not detected in sample SD14TFGH103FS and reporting limits were qualified as estimated (UJ).

SDG_17H – The MS/MSD associated with sample SD14OF1003FSH had percent recoveries less than the lower QC limit of 40 for several PCB Homologs, which may indicate low bias. Based on professional judgement, all PCB Homolog results in sample SD14OF1003FSH were qualified as estimated (J/UJ).

5.0 PCB Congeners

Lab Duplicate

SDG_01 – Sample SD14OF0802FS and its laboratory duplicate had a detection and non-detection for congener BZ# 66. The result for congener BZ# 66 in sample SD14OF0802FS was qualified as estimated (J).

SDG_03 – Sample SD14TFC202FS and its laboratory duplicate had a detection and non-detection for congener BZ# 52. The results for congener BZ# 52 in sample SD14TFC202FS was qualified as estimated (J).

LCS/LCSD

SDG_03 – The LCS associated with all samples had a percent recovery greater than the upper QC limit of 150 for congener BZ# 128 (160), which may indicate high bias. Congener BZ# 128 was detected in samples SDTFK600FS, SD15TFK601FS, and SD14TFC702FS and results were qualified as estimated (UJ).

MS/MSD

SDG_01 – The MS/MSD associated with sample SD14OF0802FS had percent recoveries greater than the upper QC limit of 150 for several PCB congeners, which may indicate high bias and RPDs greater than the QC limit of 30 for several PCB congeners. Based on professional judgement all PCB congeners in sample SD14OF0802FS were qualified as estimated (J/UJ).

SDG_04 – The MS/MSD associated with sample SD15TFH1203FS had RPDs greater than the QC limit of 30 for several PCB congeners. All PCB congeners were not detected in sample SD15TFH1203FS and reporting limits were qualified as estimated (UJ).

SDG_05H – The MS/MSD associated with sample SD14OF1803FSH had percent recoveries greater than the upper QC limit of 150 for congener BZ# 153 (155), which may indicate high bias and RPDs greater than the QC limit of 30 for congener BZ# 138 (39), congener BZ# 153 (53), congener BZ# 180 (36), and congener BZ# 187 (31). Detections of congener BZ# 138, congener BZ# 153, congener BZ# 180, and congener BZ# 187 were qualified as estimated (J/UJ).

Surrogates

SDG_05H - Sample SD14OF1303FSH had a percent recovery greater than the upper QC limit of 150 for the surrogate PCB 198 (190), indicating a potential high bias. All positive results for sample SD14OF1303FSH were qualified as estimated (J).

6.0 METALS

LCS/LCSD

SDG_03 – The SRM associated with all samples had a percent recovery less than the lower QC limit of 75 for chromium (69), which may indicate low bias. The chromium results in all samples were qualified as estimated (J/UJ).

SDG_05H – The SRM associated with all samples had a percent recovery less than the lower QC limit of 75 for chromium (68), which may indicate low bias. The chromium results in all samples were qualified as estimated (J/UJ).

SDG_08 – The SRM associated with all samples had a percent recovery less than the lower QC limit of 75 for chromium (69), which may indicate low bias. The chromium results in all samples were qualified as estimated (J/UJ).

MS/MSD

SDG_01 – The MS/MSD associated with sample SD14OF0802FS had a percent recovery less than the lower QC limit of 75 for copper (46), indicating a potential low bias. Copper results in all associated samples were qualified as estimated (J).

SDG_07 – The MS/MSD associated with sample SD14OF0502FS had a percent recovery less than the lower QC limit of 75 for lead (40), indicating a potential low bias. Lead results in all associated samples were qualified as estimated (J).

SDG_10 – The MS/MSD associated with sample SD14TFGH103FS had percent recoveries less than the lower QC limit of 75 for chromium (36/59), indicating a potential low bias. Chromium results in all associated samples were qualified as estimated (J).

SDG_12 – The MS/MSD associated with sample SD15TFGH1203FS had a percent recovery greater than the upper QC limit of 125 for lead (176), indicating a potential high bias. Lead was detected in all associated samples and results were qualified as estimated (J).

SDG_12 – The MS/MSD associated with sample SD15TFGH1203FS had a percent recovery greater than the upper QC limit of 125 for mercury (141), indicating a potential high bias. Positive mercury detections were qualified as estimated (J).

7.0 TOC

No data quality issues were identified and results are interpreted to be usable as reported by the lab.

	LCS	TOC	Lab Limits	Lab Limits

Notes:

LCS = Laboratory Control Sample

MS/MSD = Matrix Spike/ Matrix Spike Duplicate

NA = Not Applicable

PAHs = Polynuclear Aromatic Hydrocarbons

PCBs = Polychlorinated Biphenyl

%R = Percent Recovery

QC = Quality Control

RPD = Relative Percent Difference

TOC = Total Organic Carbon
