Revised 8/9/11 Soil spike is based on $(2x \text{ water spike}) \times (50/1.25)$, where 50 is the final volume of soil digestate and 1.25 is the nominal digestion weight of 1.25g, except in the case of Ag, where additional Ag is added to the spike.

• Certificate of Analysis •

Product: Metals in Soil
Catalog Number: 620
Lot No.: D093-542
Cert. Issue Date: June 29, 2017
Expiration Date: October 31, 2019
Revision Number: 2.0
Revision Date: May 29, 2017

Analytical values are included as part of the certification and are reported separately from the Certificate of Analysis. Please refer to the product web resources for details and to the lot number 000002.

True Values

MERCURY TRUE VALUE CRITERIA

CV	1.00
LCW	1.25
MS	1.50
CCV	1.25

As of 6/1/13, Mercury True Value criteria is as follows:

ICV	3 ug/l
LCSW	1 ug/l
MS(aq)	5 ug/l
MS(soil)	1 ug/l
CCV	10 ug/l

• Certificate of Analysis •

Product: Metals in Soil
Catalog Number: 620
Lot No.: D093-542
Cert. Issue Date: June 29, 2015
Expiration Date: October 31, 2019
Revision Number: 2.0
Revision Date: May 29, 2017

Analytical values are included as part of the certification and are reported separately from the Certificate of Analysis. Please refer to the product web resources for details and to the lot 000002.

• Certificate of Analysis •

1. The Certificate of Analysis (COA) is the product of a testing program performed by EPA analytical facilities. The product when purchased will be a 200 mg sample of a specific material of known composition. The product is not a standard reference material. The product is not a standard reference material.
2. The impurities in the COA are listed in the table below. The analytical method used to determine the impurities is listed in the table below. The analytical method used to determine the impurities is listed in the table below.
3. The COA Performance Acceptance Limits (PALs) are based on actual data from the data collected at EPA's Performance Testing Program. The COA PALs are based on the actual data from the data collected at EPA's Performance Testing Program. The COA PALs are based on the actual data from the data collected at EPA's Performance Testing Program.
4. The COA Performance Acceptance Limits (PALs) are based on the regression equations and bias acceptance criteria specified in the COA. The COA PALs are based on the regression equations and bias acceptance criteria specified in the COA. The COA PALs are based on the regression equations and bias acceptance criteria specified in the COA.
5. The COA Data Reliability data include the mean value, percent recovery, and number of samples analyzed by the laboratory. The COA Data Reliability data include the mean value, percent recovery, and number of samples analyzed by the laboratory. The COA Data Reliability data include the mean value, percent recovery, and number of samples analyzed by the laboratory.
6. The Reference Values are equal to the mean value of the data collected at EPA's Performance Testing Program. The Reference Values are equal to the mean value of the data collected at EPA's Performance Testing Program. The Reference Values are equal to the mean value of the data collected at EPA's Performance Testing Program.
7. The impurities in the product such as metals, etc. are not included in the table below. The impurities in the product such as metals, etc. are not included in the table below. The impurities in the product such as metals, etc. are not included in the table below.

If you have any questions or need technical assistance, please call EPA technical assistance at 1-800-372-0122 or send an email to info@eraqc.com.

Quantitation Report (QT Reviewed)

Data Path : O:\Organics\DATA\BNA2\2018\Feb\Feb24\
 Data File : F202241802.D
 Acq On : 24 Feb 2018 10:14 am
 Operator : BNA2:JT
 Sample : I202241801
 Misc : wgl092764,MSAT61,.5ug/l
 ALS Vial : 2 Sample Multiplier: 1

Quant Time: Feb 26 15:36:51 2018
 Quant Method : O:\Organics\DATA\BNA2\2018\Feb\Feb24\209CONG0224BNA2.M
 Quant Title : Method 680 PCB's by GC/MS
 QLast Update : Sun Feb 25 10:49:08 2018
 Response via : Initial Calibration

Sub List : Default - All compounds listed

Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #43: Cl3-BZ#33

Original Peak Response = 4330

Manual Peak Response = 1576 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #44: C13-BZ#21/#20

Original Peak Response = 5637

Manual Peak Response = 4258 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #56: Cl4-BZ#47

Original Peak Response = 0

Manual Peak Response = 1711 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #57: C14-BZ#65/#75/#62

Original Peak Response = 6286

Manual Peak Response = 5095 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #81: Cl4-BZ#63

Original Peak Response = 1604

Manual Peak Response = 1866 M4

M4 = Poor automated baseline construction.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #92: C15-BZ#101/#90

Original Peak Response = 2144

Manual Peak Response = 2471 M4

M4 = Poor automated baseline construction.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #101: C15-BZ#83/#125/#112

Original Peak Response = 2396

Manual Peak Response = 4295 M4

M4 = Poor automated baseline construction.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #102: C15-BZ#86/#109

Original Peak Response = 1464

Manual Peak Response = 2830 M1

M1 = Split or tailing peak, auto integration stopped early resulting in false low area count.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 11:28 am Instrument : BNA2
Sample : I202241802 Quant Date : 2/25/2018 10:50 am

Compound #105: C15-BZ#87/#111

Original Peak Response = 938

Manual Peak Response = 2870 M1

M1 = Split or tailing peak, auto integration stopped early resulting in false low area count.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241803.D Operator : BNA2:JT

(#) = qualifier out of range (m) = manual integration (+) = signals summed

Quantitation Report (QT Reviewed)

Data Path : O:\Organics\DATA\BNA2\2018\Feb\Feb24\
 Data File : F202241806.D
 Acq On : 24 Feb 2018 3:10 pm
 Operator : BNA2:JT
 Sample : I202241805
 Misc : wg1092764,MSAT57,50ug/l
 ALS Vial : 6 Sample Multiplier: 1

Quant Time: Feb 26 16:05:05 2018
 Quant Method : O:\Organics\DATA\BNA2\2018\Feb\Feb24\209CONG0224BNA2.M
 Quant Title : Method 680 PCB's by GC/MS
 QLast Update : Sun Feb 25 10:49:08 2018
 Response via : Initial Calibration

Sub List : Default - All compounds listed

Data File : F202241806.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 3:10 pm Instrument : BNA2
Sample : I202241805 Quant Date : 2/25/2018 10:50 am

Compound #140: Cl6-BZ#142

Original Peak Response = 114077

Manual Peak Response = 49950 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration/Negative Proof Report

Compound #156: C15-BZ#105

Original Peak Response = 107177

Manual Peak Response = 110489 M4

M4 = Poor automated baseline construction.

Compound #139: Cl6-BZ#133

Original Peak Response = 459616

Manual Peak Response = 329269 M4

M4 = Poor automated baseline construction.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M
Data File : F202241807.D Operator : BNA2:JT
Date Inj'd : 2/24/2018 4:25 pm Instrument : BNA2
Sample : I202241806 Quant Date : 2/25/2018 10:50 am

Compound #140: Cl6-BZ#142

Original Peak Response = 469156

Manual Peak Response = 223039 M3

M3 = Misidentification of the peak (i.e. 1,4-dichlorobenzene identified as 1,3-dichlorobenzene), or misidentification from 2 partially resolved peaks not being split.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M

Compound #164: Cl6-BZ#129/#158

Original Peak Response = 411789

Manual Peak Response = 628398 M1

M1 = Split or tailing peak, auto integration stopped early resulting in false low area count.

Manual Integration/Negative Proof Report

Data Path : O:\Organics\DATA\BNA2\2018\QMethod : 209CONG0224BNA2.M

Quant Method : O:\Organics\DATA\BNA2\2018\Mar\Mar07\209CONG0224BNA2.M
Quant Title : Method 680 PCB's by GC/MS
QLast Update : Thu Mar 08 11:02:39 2018
Response via : Initial Calibration

Sub List : Homologs - Homologs Only

#14
 Dichlorobiphenyls
 Concen: 22.04 ng/mL M5
 RT: 20.180 min Scan# 1132
 Delta R.T. 2.628 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am

Tgt Ion: 222 Resp: 32617
 Ion Ratio Lower Upper
 222 100
 224 6.1 52.1 78.1#

#15
 Cl2-Conf Ion
 Concen: 17.44 ng/mL M5
 RT: 20.189 min Scan# 1133
 Delta R.T. 2.637 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am
 Tgt Ion: 224 Resp: 25809

#33
 Trichlorobiphenyls
 Concen: 83.90 ng/mL M5
 RT: 25.827 min Scan# 1814
 Delta R.T. -0.383 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am

Tgt Ion: 256 Resp: 89816
 Ion Ratio Lower Upper
 256 100
 258 9.6 76.8 115.2#

#34
 Cl3- Conf Ion
 Concen: 76.47 ng/mL M5
 RT: 25.827 min Scan# 1814
 Delta R.T. -0.383 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am
 Tgt Ion: 258 Resp: 81861

#36
 Tetrachlorobiphenyls
 Concen: 120.54 ng/mL M5
 RT: 27.598 min Scan# 1921
 Delta R.T. -0.774 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am

Tgt Ion:	292	Resp:	99558
Ion Ratio	100	Lower	Upper
290	2.2	61.0	91.4#

#37
 Cl4-Conf Ion
 Concen: 97.90 ng/mL M5
 RT: 27.598 min Scan# 1921
 Delta R.T. -0.757 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am
 Tgt Ion: 290 Resp: 80858

#106
 Pentachlorobiphenyls
 Concen: 15.34 ng/mL M5
 RT: 35.807 min Scan# 2417
 Delta R.T. 1.543 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am

Tgt Ion: 326 Resp: 15670
 Ion Ratio Lower Upper
 326 100
 324 4.1 48.7 73.1#

#107
 Cl5-Conf Ion
 Concen: 13.79 ng/mL M5
 RT: 35.807 min Scan# 2417
 Delta R.T. -1.841 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am
 Tgt Ion:324 Resp: 14085

#112
 Hexachlorobiphenyls
 Concen: 5.38 ng/mL M5
 RT: 38.753 min Scan# 2595
 Delta R.T. 1.633 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am

Tgt Ion: 360 Resp: 5278
 Ion Ratio Lower Upper
 360 100
 362 0.5 63.7 95.5#

#113
 Cl6-Conf Ion
 Concen: 3.99 ng/mL M5
 RT: 38.753 min Scan# 2595
 Delta R.T. 1.633 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am
 Tgt Ion: 362 Resp: 3920

#135
 Heptachlorobiphenyls
 Concen: 2.62 ng/mL M5
 RT: 44.893 min Scan# 2966
 Delta R.T. 3.794 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am

Tgt Ion: 394 Resp: 2628
 Ion Ratio Lower Upper
 394 100
 396 12.3 78.6 118.0#

#136
 Cl7-Conf Ion
 Concen: 1.96 ng/mL M5
 RT: 44.893 min Scan# 2966
 Delta R.T. 3.794 min
 Lab File: F203071816.D
 Acq: 8 Mar 2018 4:39 am
 Tgt Ion: 396 Resp: 1965

Quantitation Report (QT Reviewed)

Data Path : O:\Organics\DATA\BNA2\2018\Mar\Mar07\
 Data File : F203071805.D
 Acq On : 7 Mar 2018 3:13 pm
 Operator : BNA2:MJS
 Sample : WG1094741-2,HN
 Misc : WG1095518,WG1094741,ICAL14481
 ALS Vial : 5 Sample Multiplier: 1

Quant Time: Mar 09 12:21:40 2018
 Quant Method : O:\Organics\DATA\BNA2\2018\Mar\Mar07\209CONG0224BNA2.M
 Quant Title : Method 680 PCB's by GC/MS
 QLast Update : Thu Mar 08 11:02:39 2018
 Response via : Initial Calibration

Sub List : Default - All compounds listed

Compound	R.T.	QIon	Response	Conc	Units	Dev(Min)

**CT DEP Reasonable Confidence Protocols
Laboratory Analysis
QA/QC Certification Form**

1	For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed (including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the CT DEP method-specific Reasonable Confidence Protocol documents)?	YES
1a	Were the method specified preservation and holding time requirements met?	YES
1b	VPH & EPH Methods Only: Was the VPH or EPH Method conducted without significant modifications (see Section 11.3 of respective Methods)?	N/A
2	Were all samples received by the laboratory in a condition consistent with that described on the associated chain-of-custody document(s)?	YES
3	Were all samples received at an appropriate temperature (<6°C)?	YES
4	Were all QA/QC performance criteria specified in the CT DEP Reasonable Confidence Protocol documents achieved?	YES
5a	Were reporting limits specified or referenced on the chain-of-custody?	NO
5b	Were these reporting limits met?	N/A
6	For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the Reasonable Confidence Protocol documents?	NO
7	Are project-specific matrix spikes and laboratory duplicates included in this data set?	NO

Note: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1A or question B is "No", the data package does not meet the requirements for "Reasonable Confidence".

Project Name: STRATFORD ARMY ENGINE PLANT
Project Number: 3616176064.08.01

Lab Number: L1806872
Report Date: 03/14/18

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet NELAP requirements for all NELAP accredited parameters unless otherwise noted in the following narrative. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. Tentatively Identified Compounds (TICs), if requested, are reported for compounds identified to be present and are not part of the method/program Target Compound List, even if only a subset of the TCL are being reported. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

Report Date: 03/14/18

Case Narrative (continued)

Report Submission

All non-detect (ND) or estimated concentrations (J-qualified) have been quantitated to the limit noted in the MDL column.

RCP Related Narratives

Report Submission

In reference to question 5a:

Reporting limits were not specified.

TCLP Metals

In reference to question 6:

At the client's request, all submitted samples were not analyzed for the full RCP list of constituents identified in the method specific analyte list presented in the RCP documents.

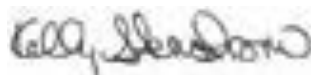

SPLP Metals

In reference to question 6:

At the client's request, all submitted samples were not analyzed for the full RCP list of constituents identified in the method specific analyte list presented in the RCP documents.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EDL	- Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).
EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NDPA/DPA	- N-Nitrosodiphenylamine/Diphenylamine.
NI	- Not Ignitable.
NP	- Non-Plastic: Term is utilized for the analysis of Atterberg Limits in soil.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.
STLP	- Semi-dynamic Tank Leaching Procedure per EPA Method 1315.
TIC	- Tentatively Identified Compound: A compound that has been identified to be present and is not part of the target compound list (TCL) for the method and/or program. All TICs are qualitatively identified and reported as estimated concentrations.

Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Final pH: As it pertains to Sample Receipt & Container Information section of the report, Final pH reflects pH of container determined after adjustment at the laboratory, if applicable. If no adjustment required, value reflects Initial pH.

Frozen Date/Time: With respect to Volatile Organics in soil, Frozen Date/Time reflects the date/time at which associated Reagent Water-preserved vials were initially frozen. Note: If frozen date/time is beyond 48 hours from sample collection, value will be reflected in 'bold'.

Initial pH: As it pertains to Sample Receipt & Container Information section of the report, Initial pH reflects pH of container determined upon receipt, if applicable.

Total: With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related

Report Format: DU Report with 'J' Qualifiers

Project Name: STRATFORD ARMY ENGINE PLANT
Project Number: 3616176064.08.01

Lab Number: L1806872
Report Date: 03/14/18

Data Qualifiers

projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).

- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. The Target analyte concentration is below the quantitation limit (RL), but above the Method Detection Limit (MDL) or Estimated Detection Limit (EDL) for SPME-related analyses. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the method detection limit (MDL) for the sample, or estimated detection limit (EDL) for SPME-related analyses.

Updates I - IIIA, 1997 in conjunction with NOAA Technical Memorandum NMFS-NWFSC-59: Extraction, Cleanup and GC/MS Analysis of Sediments and Tissues for Organic Contaminants, March 2004 and the Determination of Pesticides and PCBs in Water and Oil/Sediment by GC/MS: Method 680, EPA 01A0005295, November 1985.

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certification Information

The following analytes are not included in our Primary NELAP Scope of Accreditation:

Westborough Facility

EPA 624: m/p-xylene, o-xylene

EPA 8260C: NPW: 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene, Azobenzene; SCM: Iodomethane (methyl iodide), Methyl methacrylate, 1,2,4,5-Tetramethylbenzene; 4-Ethyltoluene.

EPA 8270D: NPW: Dimethylnaphthalene, 1,4-Diphenylhydrazine; SCM: Dimethylnaphthalene, 1,4-Diphenylhydrazine.

EPA 300: DW: Bromide

EPA 6860: SCM: Perchlorate

EPA 9010: NPW and SCM: Amenable Cyanide Distillation

SM4500: NPW: Amenable Cyanide, Dissolved Oxygen; SCM: Total Phosphorus, TKN, NO₂, NO₃.

Mansfield Facility

SM 2540D: TSS

EPA 8082A: NPW: PCB: 1, 5, 31, 87,101, 110, 141, 151, 153, 180, 183, 187.

EPA TO-15: Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene,

3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

Biological Tissue Matrix: EPA 3050B

The following analytes are included in our Massachusetts DEP Scope of Accreditation

Westborough Facility:

Drinking Water

EPA 300.0: Chloride, Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE,**

EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B

EPA 332: Perchlorate; **EPA 524.2:** THMs and VOCs; **EPA 504.1:** EDB, DBCP.

Microbiology: **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, SM9222D.**

Non-Potable Water

SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2320B, SM4500CL-E, SM4500F-BC, SM4500NH3-BH: Ammonia-N and Kjeldahl-N, **EPA 350.1:**

Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **EPA 351.1, SM4500NO3-F, EPA 353.2:** Nitrate-N, **EPA 351.1, SM4500P-E, SM4500P-B, E,**

SM4500SO4-E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, EPA 420.1, SM4500-CN-CE, SM2540D.

EPA 624: Volatile Halocarbons & Aromatics,

EPA 608: Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II,

Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

EPA 625: SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

Microbiology: **SM9223B-Colilert-QT; Enterolert-QT, SM9221E, SM9222D.**

Mansfield Facility:

Drinking Water

EPA 200.7: Al, Ba, Be, Cd, Cr, Cu, Mn, Ni, Na, Ag, Ca, Zn. **EPA 200.8:** Al, Sb, As, Ba, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn. **EPA 245.1 Hg.**

EPA 522.

Non-Potable Water

EPA 200.7: Al, Sb, As, Be, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Ni, K, Se, Ag, Na, Sr, TL, Ti, V, Zn.

EPA 200.8: Al, Sb, As, Be, Cd, Cr, Cu, Pb, Mn, Ni, Se, Ag, TL, Zn.

EPA 245.1 Hg.

SM2340B

After printing this label:

1. Use the "Print" button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipment. Using a photocopy of this label for shipping purposes is the shippers' and could result in additional billing charges, along with the cancellation of your FedEx account number. Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery or misrouting, unless you declare a higher value. Pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$1,000, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, per current FedEx Service Guide.

1.0 INTRODUCTION

KEMRON Environmental Services, Inc. (KEMRON) is pleased to present AMEC Foster Wheeler (AMEC) with an interim report for the dewatering study performed on materials from the Stratford Dewatering Site (the site) located at the Stratford Army Engine Plant in Stratford, Connecticut. The purpose of the dewatering study was to evaluate Gravity Drainage Belt Filter Press, Centrifuge, Recessed Plate and Geotube (geotextile bag testing) dewatering techniques in order to increase the material percent solids and density for potential disposal or re-use. In addition, KEMRON evaluated the ability of commonly available reagents and additives capable of improving the physical characteristics of the sediment, primarily moisture / free moisture content and strength. This interim report will primarily describe the protocol used during testing of the site materials as well as the results of testing performed.

In addition to dewatering evaluations, KEMRON was tasked with conducting solidification / stabilization simulations on candidate dewatered materials. Solidification / stabilization testing was performed to evaluate the potential for commonly available additives to improve the physical characteristics, primarily moisture reduction and strength, of the candidate dewatered materials.

This study was performed in general accordance with the Scope of Work (SOW) provided by AMEC dated August 31, 2017 and subsequent telephone and electronic mail conversations between KEMRON and AMEC.

2.0 MATERIAL RECEIPT AND CHARACTERIZATION

On October 6, 2017, KEMRON received two (2) samples from the site including sediment and surface water samples. The individual site composite sediment and composite water materials were prepared, homogenized and containerized prior to shipment to KEMRON's laboratory in Atlanta, Georgia. On receipt, all materials were logged into KEMRON's sample tracking database and placed in secure, refrigerated storage maintained at a temperature of 4 degrees Celsius (°C). Prior to testing KEMRON re-homogenized each site material to ensure uniform materials for testing. A copy of the sample Chain of Custody Record is included in **Appendix A**.

Homogenization was performed on the composite sediment material by placing the sediment material into a large plastic mixing bin. The sediment material was blended by hand until visually homogenous. Note that a layer of free liquid was observed on the surface of the as-received sediment material at the time of the shipment receipt. These liquids were re-incorporated into the sediment material during homogenization. Similarly, the surface water was homogenized by pouring the surface water into a large mixing container and blending until visually homogenous.

After homogenization aliquots of the as-received sediment were subjected to the following untreated material characterization testing:

<u>Parameter</u>	<u>Method</u>
Moisture Content	ASTM D2216
Bulk Unit Weight	ASTM D7263
Grain Size Distribution	ASTM D422
Atterberg Limits	ASTM D4318
USCS Classification	ASTM D2487

Results of untreated characterization testing are presented in **Table 1**. Copies of the physical properties testing data sheets are included in **Appendix B**. The following is a summary of the information presented in Table 1:

TABLE 1
UNTREATED PHYSICAL PROPERTIES TESTING

TESTING PARAMETER	TEST METHOD	UNIT	SAMPLE ID

Clay		%	11.8
Sample Description	ASTM D2487		Dark brown elastic silt with sand
Sample Classification	ASTM D2487		MH

Notes:

% = Percent

pcf = pounds per cubic foot

Sample descriptions based on the Unified Classification System.

Sample color determined by the Munsell Soil Color Charts.

Review of the data in **Table 1** shows the composite sediment is composed mainly of silt at 64.3 percent (%) with a plasticity index of 33 and is classified as MH and described as s dark brown elastic silt with sand. The sediment exhibited a bulk unit weight of 98.7 pounds per cubic foot (pcf) and had a percent solids of 57.91%.

In addition to the as-received sediment material, KEMRON prepared a simulated raw hydraulic dredge (RHD) material consisting of the sediment combined with the surface water. Prior to preparing the RHD material, KEMRON sieved the as-received sediment material through a #200 sieve. The material passing the sieve was utilized in preparing the RHD material and the retained material was bagged and placed into storage. The material passing the #200 sieve represented approximately 76% of the solids present in the as-received sediment material. The RHD material was prepared to create a material exhibiting a solids content of approximately 6 to 8%. KEMRON prepared a large batch of the RHD at an approximately ratio of 16:1 surface water to sieved sediment material. Moisture content testing performed on the RHD indicated a percent solids content of 6.02% was achieved.

Note that all analytical testing conducted during the course of the study was performed by EnviroSystems, Inc. located in Hampton, New Hampshire. Note that all analytical testing was subcontracted and managed by AMEC. As such this report does not include the results of any analytical testing performed on the untreated or treated materials.

3.0 POLYMER EVALUATIONS

KEMRON prepared approximately one (1) gallon of the simulated raw hydraulic dredge (RHD) material at approximately 6% solids as directed by AMEC. KEMRON forwarded the prepared slurry to WaterSolve, a polymer distributor and expert in polymer applications and testing. WaterSolve conducted a series of jar tests in order to determine the most effective polymers (coagulants and flocculants included) and dosage for the site material. Polymer effectiveness was determined by visual observations such as sediment floc, water release rate, and water clarity. Results of the polymer evaluations indicate that a single product application of the polymer "Solve 137", a cationic organic flocculant, at a dosing rate of 2.3 pounds per dry ton (lbs/dry-ton) is recommended. WaterSolve indicated that an increase in polymer addition of 5% above the recommended dosage may increase treatment effectiveness when a mechanical dewatering process is utilized. KEMRON conducted a series of jar tests to evaluate the polymer effectiveness at increased dosing rates of +2.5% and +5.0%. KEMRON observed there to be little difference in the settling rate and water clarity with the increased polymer dosing rates. Therefore, KEMRON continued to use the recommended dosage of 2.3 lb/dry-ton throughout the duration of the study. Complete polymer evaluation reports from WaterSolve are provided in **Appendix C**. Contact information for WaterSolve is included below:

Doug Walker

4.0 MECHANICAL DEWATERING EVALUATIONS

KEMRON evaluated three (3) mechanical dewatering technologies including the Belt Filter Press, Centrifugation and Recessed Plate (Baroid filter press). Testing was conducted on the RHD material with a 6.02% solids content which had been conditioned with the Solve 137 polymer at an addition rate of 2.3 lb/dry ton.

4.1 Crown Belt Press Testing

The Crown Belt Press is an instrument designed to simulate the action of a sludge dewatering belt filter press. The press permits rapid evaluation of conditioners and belt materials for a given application. The Crown Belt Press removes water from treated material in a fashion comparable to a full-scale press and allows for the collection of data pertinent to the belt press process. KEMRON performed some trial runs on various filter media provided by National Filter Media. KEMRON observed the Red Twill media to perform the most effectively while allowing the filter cake to release from the media without leaving behind residual. For each test, KEMRON used a 1,000 milliliter (mL) aliquot of the prepared slurry containing approximately 6.02% solids. KEMRON conditioned the slurry with the appropriated polymer and dosage (13.3ml) and poured the conditioned slurry through the gravity drain funnel and filter media provided with the crown belt press. KEMRON timed the release of water until water no longer dripped through the funnel, a period requiring 20 minutes. KEMRON removed the filter cake from the gravity drain funnel and placed it between the belt press media. In accordance with the Crown Belt Press manufacturers recommended procedure, each belt press test consisted of three squeezes, each one greater in tension than the previous to simulate the different treatment zones of a typical belt filter press.

KEMRON conducted the first squeeze by slowly increasing the belt tension until either the material began to overflow the belt pair or significant dewatering was observed. Once the belt tension stabilized, KEMRON recorded the peak tension in pounds. KEMRON recorded a tension of 103 pounds for the first squeeze. The belt tension was released and a second squeeze was conducted by rapidly increasing the belt tension until dewatering occurred and the peak tension of 163.5 pounds was recorded. Squeeze number three was conducted in the same manner as squeeze number two with a maximum tension of 207.5 pounds.

Upon completion of three squeezes using the above testing regimen, KEMRON removed the pressed cake from the belt and performed moisture / solids content, and paint filter testing. The crown belt press simulation resulted in the collection of 920 ml of effluent liquid collected during the initial gravity drainage of the 1,000 gram feed sample, a collection of 49 ml of effluent collected during the first squeeze, 3 ml during the second squeeze, and 2 ml collected during the final squeeze. The final moisture content of the treated material was 88.97% and the solids content was a 52.92%. The treated crown belt press material passed paint filter testing. Additionally, KEMRON forwarded an aliquot of the collected effluent and resultant solids for analytical testing.

The belt press dewatering simulations were conducted in accordance with the operating procedures for the Crown belt press. KEMRON understands that the number of squeezes and the belt tensions utilized are relevant for full-scale belt press applications and design purposes. However, the testing parameters utilized may not represent all equipment and contractor treatment procedures. The results of the crown belt filter testing is presented in Table 2 and the bench top data sheet is included in **Appendix D**.

Belt Press testing conducted using Red Twill belt press material from National Filter Media

Filter Press testing conducted using Micronics Polypropylene Mono/Multi Satin 3.3-4.4 CFM Filter Cloth Style 8944

Centrifuge testing was performed at 1,500 revolutions per minute for a period of 10 minutes

All testing conducted on screened material <#200 Sieve

(1) = Selection and dosage of polymer "Solve 137" determined by WaterSolve

PT = Polymer Treated

% = percent

mL=milliliters

lb = pounds

4.2 Centrifugation Testing

KEMRON performed centrifuge testing on the polymer conditioned 6.02% solids RHD material by placing a 1,000 mL aliquot of the prepared slurry into Teflon bottles. The samples were then placed into a large capacity centrifuge and centrifuged for a period of 10 minutes at a 1,500 rotations per minute (RPM). After treatment, the water was decanted from the top of the settled sediment and the sediment was removed from the bottom of centrifuge bottles and subjected to moisture / solids content and paint filter testing. The results of the centrifuge testing is also included in **Table 2** and bench data sheets are found in **Appendix D**.

Review of the data in Table 2 shows that 930 ml of liquid was decanted from the surface of the centrifuged sediment materials. The final moisture content of the residual solids was 135.87% and the solids content was measured at 42.4%. The centrifuged solids material passed paint filter testing.

4.3 Recessed Plate (Baroid Filter Press) Testing

Baroid Filter Press testing is a dewatering simulation where positive pressure is applied to the site material. This testing is considered a viable simulation to evaluate dewatering applications such as plate and frame treatments. Filter press testing was performed at a positive pressure of 100 pounds per square inch (psi). Each stainless steel Baroid Filter Press chamber was lined with a Micronics Filter Cloth Style 8944. The provided filter cloth was a polypropylene mono/multi satin weave with a 3.3-3.4 cubic feet per minute (CFM) air flow rate.

KEMRON placed 400 mL of the polymer conditioned test slurry into the Baroid filter press chamber. A positive 100 pounds per square inch (psi) air pressure was introduced into the chamber to force any free liquid from the test material, and was continued for approximately six (6) minutes until breakthrough occurred. After air breakthrough occurred, KEMRON removed the filter cake from the test chamber and tested the sample for moisture / solids content and paint filter. The results of Baroid filter press testing are summarized in **Table 2**, and bench data sheets are included in **Appendix D**.

Review of Table 2 shows that 370 ml of effluent was collected from the approximately 400 ml test sample, and the treated filter cake had a moisture content of 133.16% with a solids content of 42.94%. The treated filter cake passed paint filter testing. Specifications on the filter media used can be obtained by contacting:

5.0 GEOTEXTILE FABRIC TESTING

KEMRON performed both the Rapid Dewatering Test (RDT) and GeoTube Dewatering Test (GDT) in accordance with Tencate testing procedures. Testing was performed on a Raw Hydraulic Dredge material specifically prepared for the GeoTube testing. This GeoTube RHD material was developed by adding site surface water to the as-received site sediment material (not sieved separated) until a percent solids content of approximately six (6) percent was achieved. Prior to performing the RDT and GDT testing, the GeoTube RHD material was conditioned with the polymer in accordance with the protocol outlined by WaterSolve. The RDT is designed to provide an indication if dewatering with GeoTubes is feasible. GeoTubes are also used to evaluate the efficiency of polymers, measure the volume of effluent filtrate for the treated sediment, record time for filtration and analyze the quality of effluent water.

5.1 Rapid Dewatering Testing (RDT)

KEMRON performed RDT testing using GeoTube GT 500 fabric provided by Tencate. GeoTube 500 fabric is recommended by Tencate because it is the most commonly used fabric for dewatering sediment materials. RDT tests consisted of a 1,000 mL aliquot of prepared slurry at approximately 6% solids. KEMRON treated the slurry with the appropriate polymer and dosage recommended by WaterSolve and poured the conditioned slurry through the GT 500 fabric. Effluent drainage was timed and the amount of effluent collected was recorded after 1 minute of draining and again after 60 minutes. After 60 minutes, aliquots of the filter cake material were subjected to percent solids content and paint filter testing. The results of RDT testing is included in **Table 3**. Review of Table 3 shows that the RDT cake residual exhibited a solids content of 32.21% and failed the paint filter testing. Note that KEMRON understands that the RDT testing procedure does not produce the same quality of sediment as a full scale GeoTube application is capable of producing and is not representative of potential full-scale applications. The RDT testing is a quick screening test to evaluate the feasibility of GeoTube dewatering and compare the effectiveness of various polymers. Bench data sheets are included in **Appendix E**.

Specifications for the GeoTube GT 500 fabric can be obtained by contacting Tencate.

Chris Timpson, Engineering Business Mgr-Southeast
Tencate
3680 Mount Olive Road
Commerce, GA 30529
706-693-1833

5.2 GeoTube Dewatering Testing (GDT)

KEMRON performed the GDT testing using GeoTube GT 500 fabric bags provided by Tencate. KEMRON passed fifteen (15) gallons of polymer conditioned RHD slurry through the GT 500 bags. The sediment was allowed to drain for a period of 24 hours prior to performing physical properties testing on the dewatered sediment. The results of the GDT testing are provided in **Table 3**. These results show that after 24 hours of draining, the dewatered cake material had a solids content of 49.17% and passed paint filter testing. Data sheets for all GDT testing is included in **Appendix E**. KEMRON also forwarded aliquots of the GDT effluent and resultant solids to an EnviroSystems, Inc.

DEW-SED-PT-GDT*	6.06	2.3	49.17	Pass

Notes:

% = percent

6.0 GRAVITY DRAINAGE TESTING

KEMRON performed gravity drainage testing on the as-received composite sediment at the request of AMEC. Unlike the previous dewatering testing, the feed material for the gravity drainage test was not screened (not sieved), and was not treated with polymer. Gravity drainage testing was performed to evaluate the reduction in moisture that may be achieved by allowing the site material to gravity drain during barge decanting/dewatering and or while stockpiled during field operations. In order to simulate the process on the laboratory scale, testing was performed by allowing a known quantity of the untreated material to drain via gravity through a porous filter paper media with a particle retention size of 25 microns which is consistent with silt sized particles. Prior to performing gravity drainage testing AMEC had requested that an additional 15% site surface water addition be adjusted for the gravity drainage test. KEMRON added 15% site surface water by wet bulk weight to the samples prior to testing. For example with a 1,000 g aliquot of sediment, KEMRON blended 150 ml of site surface water.

KEMRON placed approximately 1,134.5 grams of the surface water and as-received composite sediment mixture into a pre-weighed funnel lined with the filter media and allowed it to drain for a period of 72 hours. After 72 hours, KEMRON performed solids content, pocket penetrometer, shear strength, painter filter testing, and unconfined compressive strength (UCS) testing. Results of the gravity drainage testing are presented in **Table 4**.

At the request of AMEC, KEMRON continued gravity drainage testing for an additional 2 days, a total treatment period of 5 days. KEMRON observed a slight continuation of free liquid removal from the test material after 5 days. Over the additional 2 days of testing a total of 18 ml of additional effluent was collected. At the termination of the 5 day gravity drain testing the percent solids content was 56.52%, an increase of 0.2% compared to the 72 hour gravity drainage sediment. The results of testing performed on the 5 day gravity drainage material is also summarized in **Table 4**.

The results presented in **Table 4** indicate the material does not gravity drain very well. Only 80 grams of effluent were collected over a 72 hour period. The cake percent solids was determined to increase from 50.36% in the feed stock to 56.32% in the treated cake after 5 days of draining. The treated sediment material exhibited a density of 92.9 pcf, a shear strength of 0.10 kilograms per square centimeter (Kg/cm^2) but no recordable pocket penetrometer strength. The treated sediment material failed paint filter testing and could not undergo UCS testing because the material lacked sufficient strength to maintain its shape prior to testing. Gravity drainage testing data sheets can be found in **Appendix F**

7.0 ADDITIONAL DEWATERING TESTING

Following review of the mechanical and gravity drainage dewatering simulations, AMEC requested that additional dewatering testing be performed to evaluate the effectiveness of the Baroid filter press treatment with and without the use of polymer conditioning, and to determine if a higher treatment pressure of 125 psi provided additional treatment effectiveness. KEMRON conducted the following dewatering testing:

- DEW-SED-FilterPress (Baroid filter press) at 100 psi with no polymer
- DEW-SED-PT-FilterPress (Baroid filter press) at 125 psi with polymer conditioning
- DEW-SED-FilterPress (Baroid filter press) at 125 psi with no polymer

The results of the additional mechanical dewatering simulations are summarized in **Table 5**. All treatment simulations were conducted in accordance with the previously discussed treatment protocols. Note that KEMRON has included the results of the Crown belt press, centrifugation treatment, and baroid filter press testing which were originally presented in Table 2 to compare potential treatment effectiveness.

Review of **Table 5** indicates that the use of polymer conditioning significantly reduces the effectiveness of dewatering using this treatment application. Additionally an increase in treatment pressure did not provide an increase in treatment effectiveness. Bench top testing data sheets for the additional dewatering simulations are found in **Appendix G**.

8.0 SOLIDIFICATION / STABILIZATION EVALUATIONS

The primary applications of solidification / stabilization include 1) treatment of liquids and sludges for land disposal, 2) remediation of contaminated sites containing organic and inorganic contaminants, and 3) solidification of materials which are physically unstable. In the remainder of this discussion, the terms solidification, stabilization and immobilization will be used interchangeably. To perform solidification treatment, common binding reagents or proprietary reagents are added to the untreated waste materials. Common binding agents may include materials like Portland cement, blast furnace slag, cement or lime kiln dusts, fly ash and organophillic clays. For this project Type I Portland cement and Mintek's Calciment® product were the only solidification reagents utilized.

Solidification Evaluations

Based on the data from the dewatering phases of the study, AMEC selected two dewatered materials for solidification evaluations. KEMRON conducted bulk dewatering treatments including; 1) Crown Belt Filter simulations on the polymer treated RHD material, which exhibited an initial solids content of approximately six (6) percent. KEMRON performed numerous belt filter treatments to produce the necessary quantity of treated material for solidification evaluations. The typical results for the effectiveness of belt filter treatment is outlined in **Table 2**, and 2) Gravity Drainage treatment which was conducted on the as-received sediment material with an additional 15% surface water incorporation. Typical results for gravity drainage dewatering is summarized in **Table 4**.

KEMRON prepared a total of twelve (12) solidification mixtures including three (3) mixtures using Type I Portland cement for both the belt press and gravity drainage treated materials, and 3 mixtures for each dewatered material using the Mintek Calciment® material. The mixture design formulations are presented in **Table 6** and bench top mixture development data sheets are included in **Appendix H**. The mixtures were developed by placing an aliquot of the appropriate dewatered material into a blending chamber. The reagent was added dry to the dewatered sediment and blended at a rate of approximately 30 to 40 rotations per minute (rpm) until visually homogeneous, approximately 60 to 90 seconds. Immediately following mixture development, the mixtures were placed and tamped into cylindrical molds for curing. Note that all reagent addition rates are calculated on a by-weight basis according to the amount of dewatered sediment being treated. For example for a mixture developed with the Belt Press dewatered material at a 5% Portland cement addition rate, 5 grams of Type I Portland cement was added dry to every 100 grams of the dewatered Belt Press material.

Throughout the curing process, KEMRON monitored the potential setting characteristics of each treated material via pocket penetrometer, and pocket Torvane shear strength testing. Penetrometer and Torvane testing was conducted at curing intervals of 1, 3, and 5 days of curing. The results of penetrometer and Torvane testing are summarized in **Table 6**. Review of this data indicates that Type I Portland cement provided higher penetrometer and Torvane shear strengths than the Calciment® material for both the belt press and gravity drainage materials. Note that with the treatment of the belt press material, the six (6) percent Portland cement addition rate achieved the maximum penetrometer strength of greater than 4.5 tons per square foot (TSF) at the 3 day cure interval and the 8% Portland cement addition did not reach the maximum penetrometer strength until the 5 day cure interval. This may be a function of water available in the material to hydrate the cement.

At the eight (8) day cure interval each solidified material was subjected to Unconfined Compressive Strength (UCS) testing in accordance with ASTM Method D1633. The results of UCS testing is also presented in **Table 6** and bench top testing data sheets are included in **Appendix I**. Table 6 indicates that the belt press dewatered sediment achieved the highest UCS strength of 71.7 pounds per square inch (psi) with a 6% addition rate of Type I Portland cement added dry. Note that the belt filter material treated with a higher addition rate of 8% Portland cement showed a lower UCS strength which may indicate there is insufficient available water to fully hydrate the cement at an 8% addition rate. The treated Gravity Drainage material exhibited the highest UCS strength of 57.2 psi at the 8-day cure, when treated with a 5% Type I Portland cement dry addition.

KEMRON conducted an additional UCS break at the 28 day cure interval to evaluate potential strength gain with longer mixture curing. Review of the 28-day UCS results presented in **Table 6** shows that significant strength gains were observed in the belt press material treated with Portland cement at addition rates of 6 and 8%. Specifically, the UCS strength of the 6% Portland cement treated belt press material increased from 72.0 to 108.3 psi from the 8 to the 28 day curing period, and the strength of the 8% Portland cement treated belt press material increased from 48.1 to 91.3 psi during the same curing interval. The Mintek Calciment treated belt press samples also showed an increase in UCS strength achieving a 31.5 psi value with a 6% Calciment addition at the 28 day cure, and a strength of 44.8 psi with an 8% Calciment addition at day 28.

Review of the 28-day UCS results for the Gravity Drainage treated materials also show significant strength gains between the 8 and 28-day cure intervals. The gravity drainage material treated with a Portland cement addition of 4% showed a strength gain from 35.8 to 61 psi over the extended curing period, and the 5% Portland treated sample exhibited a strength gain from 57.2 to 90.0 psi from the 8 to the 28-day cure period. Unlike the belt press treated materials, the gravity drainage material treated with the Mintek Calciment did not exhibit a notable increase in UCS strength.

9.0 EFFLUENT WATER TREATMENT EVALUATIONS

KEMRON performed evaluations of the quality of the effluent water collected during the bulk treatment of the RHD material using the belt filter simulations. Aliquots of the raw belt press effluent were forwarded to Alpha Analytical for total metals and total PCB analyses. To evaluate the potential reduction in metals and PCB concentrations in the effluent water, KEMRON performed filtration testing using filter media with nominal pore sizes of 0.45 microns and 0.10 microns. Aliquots of each filtered water was forwarded for analyses.

Additionally, KEMRON conducted carbon isotherm testing on both the raw effluent water from belt press treatment as well as the belt press water which had been filtered through the 0.1 micron filter media, to determine the potential effectiveness of activated carbon adsorption at reducing concentrations of PCBs from the belt press effluent water. KEMRON performed two individual carbon isotherm tests using carbon addition rates of 0.0 (a control), 10, 20, 40 and 80 grams of bituminous coal granular activated carbon (GAC) per liter of test water. The GAC material utilized in the testing was product F-400 provided by Calgon Carbon Corporation.

The isotherm testing was conducted on raw effluent water collected during belt filter treatment, and on belt filter effluent water which had been pre-filtered through a 0.1 micron filter media. Five (5) separate sample jars were prepared for each isotherm test. KEMRON placed one (1) liter of the effluent water to be tested into each of the 5 jars, and the outlined quantity of GAC was added to the appropriate jar. The jars were agitated for a period of two (2) hours using a multi-station gang stirrer equipped with stainless steel mixing paddles. Following the 2-hour mixing period each jar sample was filtered through a standard nylon paint filter and submitted to Alpha Analytical for total PCB analyses. Analytical results were provided from Alpha Analytica directly to the client and not included in this report. The Sample ID matrix for the analytical testing is as follows:

Sample Matrix for Belt Press Effluent Water Treatment

SAMPLE ID	Description

SW-DF-BFT- 80C	Belt Press Effluent water, unfiltered, 80 grams carbon/1L effluent water for Isotherm Carbon treatment. PCB analysis only.

10.0 CONCLUSIONS

KEMRON conducted treatability testing services for AMEC to evaluate potential dewatering technologies capable of increasing the solids content of mechanically dredged and simulated hydraulic dredge sediment materials from the site. KEMRON performed dewatering simulations including belt press, centrifuge, filter press, geotextile Geotube, and gravity drainage dewatering applications. Additionally, KEMRON conducted solidification treatment applications to evaluate the potential for Type I Portland cement and Calciment® to further improve the physical characteristics of candidate dewatered materials, primarily improving the strength of the treated materials.

Based on the results of testing, the use of the cationic organic flocculant “Solve 137” polymer, distributed by WaterSolve was highly effective at separating the solids and liquid phases of the simulated hydraulic dredge material, and increased the effectiveness of mechanical dewatering techniques with the exception of the Baroid filter press testing. The Baroid filter press is often utilized to simulate potential dewatering technologies such as plate and frame dewatering. Testing indicated that the Baroid filter press simulations were more effective without the use of the polymer. All of the dewatering technologies evaluated achieved some degree of solids content increase. However, gravity drainage treatment was the only dewatering technology that did not produce a treated material capable of passing paint filter testing.

Solidification evaluations were conducted on dewatered materials from gravity drainage testing and belt press treatments. Solidification reagents evaluated included Type I Portland cement and Calciment® which were individually added dry to both dewatered materials. The results of testing conducted on the treated materials during the solidification phase of the study indicate that Portland cement was more effective at increasing the UCS strength of the dewatered sediments than the Calciment® reagent. The selection of the appropriate reagent addition rate will likely be dependent on the desired UCS strength of the treated material. Testing indicated that a 6% addition of Portland cement added to the belt press residual sediment achieved a UCS value of 72.0 psi after 8 days of curing, and increased to 108.3 psi at the 28-day cure interval. The 8% Portland addition treated belt press material exhibited lower UCS values at the same cure dates with strength values of 48.1 psi after 8 days and 91.3 psi after 28 days. Treatments utilizing the Mintek Calciment reagent applied at addition rates of 6 and 8% to the belt press material achieved significantly lower strengths at the 8 day cure date but did exhibit an increase in strength at the 28-day cure time with values of 31.5 and 33.8 psi respectively.

Testing conducted on the gravity drainage dewatered sediment showed that a 4% dry addition of Portland cement showed an 8 day UCS value of 35.8 psi and increased to 61.0 psi after 28 days. The 5% addition rate of Portland cement resulted in a UCS value of 57.2 psi after 8 days of curing and increased to 90.0 psi at the 28-day cure. The gravity drainage material treated with the Calciment reagent did not exhibit a significant increase in strength from day 8 to the 28-day cure.

This report should be reviewed in its entirety including all attachments prior to making decisions concerning a remedial approach. This study is intended to suggest what will occur in the field but does not guarantee the same results.

October 24, 2017

1. Scope of Work

WaterSolve, LLC was tasked to perform a Geotube® dewatering performance trial and cone tests on a sample labelled “HOMOGENIZED SEDIMENT”. The objectives of these dewatering trials were to identify chemical conditioning program(s), identify polymer flocculent(s), and dosing rate(s) for a potential Geotube® dewatering application. The objectives of subsequent cone tests were to measure total solids (TS) of the flocculated, contained, and dewatered residual after passage through the GT500D Geotube® fabric.

2. Materials & Methods

A gallon sample collected from the Stratford dewatering project was received at WaterSolve’s Laboratory (Caledonia, MI) on October 23, 2017. Samples of residual were homogenized and 150-mL samples were placed in graduated, glass jars.

Several polymers (emulsions) were “made-down” at a 0.5% concentration for this dewatering trial. Polymer (33 to 200-ppm) was added to a sample with a 10-mL plastic syringe and moderately tumbled five to seven times. Observations of water release rate, water clarity, and flocculent appearance were recorded on appropriate data sheets (Appendix A). Polymer(s) that flocculated and dewatered these residuals most effectively were re-evaluated with lower doses in order to isolate the most efficient dewatering and flocculating polymer(s). A Hach DR 2800 was used to measure TSS (Total Suspended Solids) after the samples were poured through the Geotube® GT500D fabric with a measurable limit of up to 750-mg/L suspended solids.

Percent total solids (dry weight) of the initial residual sample and dewatered cake sample (captured on GT500D Geotube® fabric) were measured.

3. Results

Chemical conditioning with 137 was determined to flocculate and dewater the residual most effectively compared to the other products (Appendix A). Water release volume and flocculent appearance were excellent when a 2-mL dose of Solve 137 (67-ppm, 2.3-lbs/dry ton) was added to a 150-mL sample.

The provided sample was 5.8-percent dry weight solids. When a 1,000-mL sample was conditioned with Solve 137 and passed through the Geotube® GT500D fabric, percent solids increased to 35.2-percent after sixty minutes of drying time (Appendix C). From this 1,000-mL conditioned sample, 750-mL and 900-mL of water was released in minute and sixty minutes, respectively, after passage though the fabric. The TSS of the filtrate was 7-mg/L.

4. Recommendations

We recommend a product application of Solve 137 (2.3-lbs/dry ton dose) for dewatering the "HOMOGENIZED SEDIMENT" sample in a Geotube® application in order to pass a paint filter test for subsequent disposal. Solve 137 is required to be made-down at 0.5-percent with a polymer make-down unit or aged in batch/feed tanks prior to injection into the residual line. Moderate to high mixing energy is required between the polymer introduction points and the Geotube® containers (e.g., three to five bends in the discharge line and/or inline static mixers). We would anticipate an increase in the Solve 137 dosage, possibly up to 5% more, if mechanical (belt filter press or centrifuge) technologies are used for dewatering.

Expected time to being able pass a Paint Filter Test is unpredictable in a Geotube® container from these bench-scale experiments. An onsite or laboratory hanging bag or Geotube® dewatering trial (GDT) may be used and is recommended if the timeline for achieving project goals of dry weight solids and if Geotube® filtrate characteristics are in question for this application. Additional dewatering evaluations over time are recommended if project objectives for consolidation are greater than passing a Paint Filter Test.

Due to potential variability of the material, daily on-site testing and chemical conditioning verification are recommended during pumping operations.

TESTED BY: JDM
TRACKING CODE: B733_PaintFilter

TESTING PARAMETER AND RESULTS	
QUANTITY OF MATERIAL	100.97 g
LENGTH OF TEST	5.0 min.
QUANTITY OF LIQUID	0.00 g
RESULTS (PASS / FAIL) *	Pass

* In accordance with EPA Method 9095, if any liquid from the test material collects after 5 minutes of testing, the material is deemed to contain free liquids, and therefore has failed the paint filter test.

Rutgers Center for Advanced Infrastructure and Transportation
Solidification Report

AMEC Foster Wheeler Sediment Treatability Report

Robert Miskewitz Ph.D, Masoud Janbaz Ph.D., Lauren Ioccabucci, and Kelly Francisco

September 29, 2017

This report provides a summary of stabilization procedures and Unconfined Compressive Strength results for sediment using Portland cement as a binder.

Experimental Procedure: On September 1, 2017 material received from AMEC Foster Wheeler was homogenized and mixed with various ratios of Type I/II Portland cement (PC) slurry. PC was added at ratios of 6%, 8%, 12% and 14% of the wet weight of sediment. Each slurry consisted of a 1:1 ratio of PC to tap water. Table 1 provides the contents of each mixing ratio studied.

Table 1. PC-sediment Mixing Contents

Mixture ID	Type I/II PC (g)	Tap Water (mL)	Sediment (g)
6% PC	60.0	60	1000.4
8% PC	80.0	80	1000.5
12% PC	120.0	120	1000.8
14% PC	140.0	140	1000.7

Mixing continued until the operator was visually confident in the homogeneity of the mixture (Approximately 10 min). A sample of the material was collected from each mixture to determine its post-mixing moisture content. Samples for strength testing were compacted into cylindrical plastic molds with 2-inch inner diameters and 4-inch heights. The molds were cured inside a Thermocure water bath for 28 days at 20° C.

On September 28, 2017 the samples were removed from the temperature-controlled curing chamber and tested for unconfined compressive strength using an ELE Tritest50 device. The samples' weights, diameters, and heights were measured and material from each broken core was collected to determine the samples' post-curing moisture content.

Results:

Sediment Properties – Organic Content and Bulk Density: The bulk density and organic content of the raw material were determined via ASTM D2216 and ASTM D2974, respectively. The bulk density for the raw material was determined to be 1.54 g/cm³. The organic content was found to be approximately 3.8%.

Moisture Content: Table 2 provides a summary of the average moisture content of the raw material and the average post-curing moisture content for each mixing ratio.

Table 2. Average Raw Sediment and Post-curing Moisture Content

Mixture ID	Average Moisture Content (%)
Raw Sediment	79.1

6% PC	73.9
8% PC	73.1
12% PC	71.8
14% PC	72.2

Figure 1 provides a comparison between the post-mixing moisture content for each mixing ratio and the post-curing moisture content for each sample tested.

Figure 1. Post-mixing and Post-curing Moisture Content

Unconfined Compressive Strength: Table 3 provides a summary of the average unconfined compressive (UC) strength of each mixture studied. Figure 2 provides the UC strength for each sample tested.

Table 3. Average Unconfined Compressive Strength Values

Mixture ID	Average UC Strength		
	(kPa)	(psi)	(tsf)
6% PC	560	81	5.8
8% PC	725	105	7.6
12% PC	1029	149	10.7
14% PC	1174	170	12.3

APPENDIX D

Tidal Gate Removal Permit

June 7, 2012

**CERTIFIED MAIL
RETURN RECEIPT REQUESTED**

City of Bridgeport
John Ricci
1000 Great Meadow Drive
Stratford, CT 06615

Subject: Certificate of Permission #201201271-KZ
Sikorsky Memorial Airport, 1000 Great Meadow Drive, Stratford

Dear Mr. Ricci:

Enclosed please find a copy of the certificate of permission ("certificate") which is being issued pursuant to your application of April 8, 2012. Your attention is directed to the conditions of the enclosed certificate. All work must conform to that which is specifically authorized by this certificate. Any work in tidal wetlands or waterward of the high tide line in tidal, navigable and coastal waters of the State which has not been authorized by a valid permit or certificate is a violation of state law and subject to enforcement action by the Department of Energy and Environmental Protection and the Office of the Attorney General.

Your initiation of authorized activities will be relied upon as your agreement to comply with the terms and conditions of the certificate. Please note that Appendix B of the certificate has been enclosed for your convenience to comply with Connecticut General Statutes Section 22a-363g. Also, the Permit Notice, found at the back of your authorization, must be posted at the work area while the work is being undertaken. Please refer to the SPECIAL TERMS AND CONDITIONS of your certificate for further details.

If you have not already done so, you should contact your local Planning and Zoning Office to determine local permit requirements for your project. Also, your activity may be eligible for General Permit authorization from the U.S. Army Corps of Engineers ("Corps"). Most maintenance and reconstruction activities require no further authorization from the Corps. Other activities, generally involving work in tidal wetlands or other special aquatic sites, and in or near a federal Navigation Project or involving filling, must receive written authorization from the Corps prior to beginning work. The State of Connecticut will automatically forward this certificate to the Corps for its determination of General Permit eligibility. You do not need to apply directly to the Corps unless they notify you. For more information regarding this federal process, you may write to the Corps New England Division, Regulatory Branch, 696 Virginia Road, Concord, Massachusetts, 02254 or call 978-318-8335 or 800-343-4789.

Sincerely,

Kevin Zawoy, Environmental Analyst
Office of Long Island Sound Programs
Bureau of Water Protection and Land Reuse

CERTIFICATE OF PERMISSION

Certificate No: 2012001271-KZ

Municipalities: Stratford

Site of Activity: Sikorsky Memorial Airport, 1000 Great Meadow Drive, earthen berm at western end of marine basin

Certificate Holder: City of Bridgeport
1000 Great Meadow Drive
Stratford, CT 06615

Pursuant to section 22a-363b of the Connecticut General Statutes ("CGS") and in accordance with CGS section 22a-98, CGS sections 22a-359 to 22a-363f, CGS sections 22a-28 through 22a-35, and the Connecticut Water Quality Standards effective February 25, 2011, a certificate of permission ("certificate") is hereby granted to remove an existing tide gate and berm for tidal wetlands restoration as is more specifically described below in the SCOPE OF AUTHORIZATION.

*******NOTICE TO CERTIFICATE HOLDER AND CONTRACTORS*******

UPON INITIATION OF ANY WORK AUTHORIZED HEREIN, THE CERTIFICATE HOLDER ACCEPTS AND AGREES TO COMPLY WITH ALL TERMS AND CONDITIONS OF THIS CERTIFICATE. FAILURE TO CONFORM TO THE TERMS AND CONDITIONS OF THIS CERTIFICATE MAY SUBJECT THE CERTIFICATE HOLDER AND ANY CONTRACTOR TO ENFORCEMENT ACTIONS, INCLUDING INJUNCTIONS AS PROVIDED BY LAW AND PENALTIES UP TO \$1,000.00 PER DAY PURSUANT TO THE ADMINISTRATIVE CIVIL PENALTY POLICY DESCRIBED IN SECTIONS 22a-6b-1 THROUGH 22a-6b-15 OF THE REGULATIONS OF CONNECTICUT STATE AGENCIES ("RCSA").

SCOPE OF AUTHORIZATION

The Certificate Holder is hereby authorized to conduct the following work as described in application #201201271-KZ, including 9 sheets of plans, Figures 1 through 8, and one sheet entitled "Vicinity Map" dated September 2011 submitted by the Certificate Holder to the Commissioner of Energy and Environmental Protection ("Commissioner") and attached hereto:

1. remove an existing tidal gate and section of earthen berm located south of the existing gravel driveway located off Main Street, Route 113 as follows:

- a. temporarily install a turbidity control curtain on the upstream and downstream sides of the area of proposed removed earthen berm as shown on Figure 4., of the plans attached hereto;
- b. excavate approximately 525 cubic yards of earthen fill including removal of an existing reinforced concrete tide gate structure and pipe over an approximately 6,000 square foot area to a depth of -2.0' NGVD a 20 foot wide base and 3:1 side slopes terminating at elevation 5.75' NGVD; and with
- c. place a minimum of 6 inches of a sandy loam if required on the 3:1 side slopes to enhance tidal wetland plant growth and cover the side slopes with a biodegradable matting.

SPECIAL TERMS AND CONDITIONS

1. Prior to the commencement of the work authorized herein, the Certificate Holder shall test the authorized excavated material to characterize contamination levels for proper disposal in accordance with state statutes. If Raymark waste is identified EPA and CT DEEP Remediation must be notified and any actions must be approved by EPA and the CT DEEP in writing.
2. Prior to the commencement of work authorized here, the Certificate Holder shall submit a stockpile and haul road location plan for the Commissioner's review and written approval to address potential adverse environmental impacts to a known state listed plant species which has been identified to exist at the site. Such stockpile area must be outside of the 100 year floodplain. The Certificate Holder shall follow any recommendations made by the Commissioner in writing
3. Prior to the commencement of the work authorized herein, the Certificate Holder shall submit to the Commissioner for review and written approval an up-dated hydraulic analysis to demonstrate that the work authorized herein will not result in increased flooding of existing or relocated Main Street (Route 113) located at the site.
4. Prior to the commencement of work authorized here, the Certificate Holder shall submit an on-site evaluation for the Commissioner's review and written approval which demonstrates that any contaminated areas that will be subject to tidal action once the work authorized herein is complete have been appropriately remediated to the Commissioner's satisfaction. The Certificate Holder shall follow any recommendations made by the Commissioner in writing.
5. Upon obtaining written permission for SPECIAL TERMS AND CONDITIONS paragraphs 1. through 4., above, the Certificate Holder shall complete all the work authorized in the SCOPE OF AUTHORIZATION within 90 calendar days.
6. Prior to the commencement of work authorized here, the Certificate Holder shall install and maintain the turbidity control curtain described in the SCOPE OF AUTHORIZATION paragraph 1.a., above, in good working condition until the work authorized herein is completed

and the site stabilized.

7. All excavated sediments shall be immediately placed within lined and sealed dump trucks and relocated to an upland stockpile/dewatering area that is outside the 100 year flood plain. All stockpile/dewatering areas shall be covered and bordered with straw bales or silt fence as shown on Figure 7., of the plans attached hereto.
8. Except as specifically authorized by this permit, no equipment or material including but not limited to, fill, construction materials, excavated material or debris, shall be deposited, placed or stored in any tidal wetland or watercourse, nor shall any tidal wetland or watercourse be used as a staging area or accessway other than as provided herein.
9. The Certificate Holder shall post the attached Permit Notice in a conspicuous place at the work area while the work authorized herein is undertaken.
10. All work authorized here shall be conducted during periods of low water conditions.
11. Upon excavation of the authorized 3:1 side slopes described in the SCOPE OF AUTHORIZATION paragraph 1.c., above, the Certificate Holder shall apply a minimum of a 6" sand loam to the surface of the over excavated side slopes. Upon approval of the Commissioner, the Certificate Holder may forego the 6" layer of sandy loam if a demonstration can be made that adequate plant soils are already present within the excavated area. In any event, the Certificate Holder shall apply the biodegradable matting shown on the plans. Such biodegradable matting must be maintained in good condition until the site has become stabilized.
12. Not later than two (2) weeks prior to the commencement of any work authorized herein, the Certificate Holder shall submit to the Commissioner, on the form attached hereto as Appendix A, the name(s) and address(es) of any contractor(s) employed to conduct such work and the expected date for commencement and completion of such work.
13. The Certificate Holder shall file Appendix B on the land records of the municipality in which the subject property is located not later than thirty (30) days after certificate issuance pursuant to CGS Section 22a-363g. A copy of Appendix B with a stamp or other such proof of filing with the municipality shall be submitted to the Commissioner no later than sixty (60) days after certificate issuance. Except as specifically authorized by this certificate, no equipment or material including, but not limited to, fill, construction materials, excavated material or debris, shall be deposited, placed or stored in any wetland or watercourse on or off-site, nor shall any wetland or watercourse be used as a staging area or accessway other than as provided herein.
14. The Certificate Holder shall give a copy of this permit to the contractor(s) who will be carrying out the activities authorized herein prior to the start of construction and shall receive a written receipt for such copy, signed and dated by such contractor(s). The Certificate Holder's contractor(s) shall conduct all operations at the site in full compliance with this permit and, to the extent provided by law, may be held liable for any violation of the terms and conditions of this permit. At the work area the contractor(s) shall, whenever work is being performed, make

available for inspection a copy of this permit and the final plans for the work authorized herein.

15. On or before ninety (90) days after completion of the work authorized herein, the Certificate Holder shall submit to the Commissioner "as-built" plans, including any proposed elevation views and cross sections included in the permit, prepared and sealed by a licensed engineer, licensed surveyor or licensed architect, as applicable, of the work area showing all tidal datums and structures.

GENERAL TERMS AND CONDITIONS

1. All work authorized by this certificate shall be completed within five years from date of issuance of this certificate ("work completion date") in accordance with all conditions of this certificate and any other applicable law.
 - a. The Certificate Holder may request a one-year extension of the work completion date. Such request shall be in writing and shall be submitted to the Commissioner at least 30 days prior to said work completion date. Such request shall describe the work done to date, which work still needs to be completed and the reason for such extension. The Commissioner shall grant or deny such request in her sole discretion.
 - b. Any work authorized herein conducted after said work completion date or any authorized one year extension thereof is a violation of this certificate and may subject the Certificate Holder to enforcement action, including penalties, as provided by law.
2. In conducting the work authorized herein, the Certificate Holder shall not deviate from the attached plans, as may be modified by this certificate. The Certificate Holder shall not make de minimis changes from said plans without prior written approval of the Commissioner.
3. The Certificate Holder shall maintain all structures or other work authorized herein in good condition. Any such maintenance shall be conducted in accordance with applicable law including, but not limited to, CGS sections 22a-28 through 22a-35 and CGS sections 22a-359 through 22a-363f.
4. The Certificate Holder shall notify the Commissioner in writing of the commencement of any work and completion of all work authorized herein no later than three days prior to the commencement of such work and no later than seven days after the completion of such work.
5. In undertaking the work authorized hereunder, the Certificate Holder shall not cause or allow pollution of wetlands or watercourses, including pollution resulting from sedimentation and erosion. For purposes of this certificate, "pollution" means "pollution" as that term is defined by CGS section 22a-423.
6. Upon completion of any work authorized herein, the Certificate Holder shall restore all areas impacted by construction, or used as a staging area or accessway in connection with such work, to their condition prior to the commencement of such work.

7. Any document required to be submitted to the Commissioner under this certificate or any contact required to be made with the Commissioner shall, unless otherwise specified in writing by the Commissioner, be directed to:

Permit Section
Office of Long Island Sound Programs
Department of Energy and Environmental Protection
79 Elm Street
Hartford, Connecticut 06106-5127
(860) 424-3034
Fax # (860) 424-4054

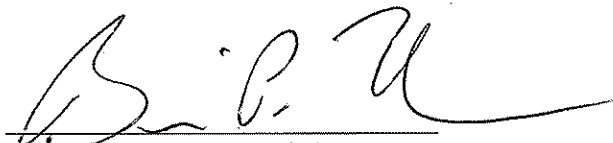

8. The date of submission to the Commissioner of any document required by this certificate shall be the date such document is received by the Commissioner. The date of any notice by the Commissioner under this certificate, including but not limited to notice of approval or disapproval of any document or other action, shall be the date such notice is personally delivered or the date three days after it is mailed by the Commissioner, whichever is earlier. Except as otherwise specified in this certificate, the word "day" as used in this certificate means calendar day. Any document or action which is required by this certificate to be submitted or performed by a date which falls on a Saturday, Sunday or a Connecticut or federal holiday shall be submitted or performed on or before the next day which is not a Saturday, Sunday, or a Connecticut or federal holiday.
9. The work specified in the SCOPE OF AUTHORIZATION is authorized solely for the purpose set forth in this certificate. No change in purpose or use of the authorization work or facilities as set forth in this certificate may occur without the prior written authorization of the Commissioner. The Certificate Holder shall, prior to undertaking or allowing any change in use or purpose from that which is authorized by this certificate, request authorization from the Commissioner for such change. Said request shall be in writing and shall describe the proposed change and the reason for the change.
10. This certificate may be revoked, suspended, or modified in accordance with applicable law.
11. This certificate is not transferable without prior written authorization of the Commissioner. A request to transfer a certificate shall be submitted in writing and shall describe the proposed transfer and the reason for such transfer. The Certificate Holder's obligations under this certificate shall not be affected by the passage of title to the certificate site to any other person or municipality until such time as a transfer is authorized by the Commissioner.
12. The Certificate Holder shall allow any representative of the Commissioner to inspect the work authorized hereunder at reasonable times to ensure that it is being or has been accomplished in accordance with the terms and conditions of this certificate.
13. In granting this certificate, the Commissioner has relied on all representations of the Certificate Holder, including information and data provided in support of the Certificate Holder's application. Neither the Certificate Holder's representations nor the issuance of this certificate shall constitute

an assurance by the Commissioner as to the structural integrity, the engineering feasibility or the efficacy of such design.

14. In the event that the Certificate Holder becomes aware that he did not or may not comply, or did not or may not comply on time, with any provision of this certificate or of any document required hereunder, the Certificate Holder shall immediately notify the Commissioner and shall take all reasonable steps to ensure that any noncompliance or delay is avoided or, if unavoidable, is minimized to the greatest extent possible. In so notifying the Commissioner, the Certificate Holder shall state in writing the reasons for the noncompliance or delay and propose, for the review and written approval of the Commissioner, dates by which compliance will be achieved, and the Certificate Holder shall comply with any dates which may be approved in writing by the Commissioner. Notification by the Certificate Holder shall not excuse noncompliance or delay and the Commissioner's approval of any compliance dates proposed shall not excuse noncompliance or delay unless specifically stated by the Commissioner in writing.
15. In evaluating the application for this certificate the Commissioner has relied on information and data provided by the Certificate Holder and on the Certificate Holder's representations concerning site conditions, design specifications and the proposed work authorized herein, including but not limited to representations concerning the commercial, public or private nature of the work or structures authorized herein, the water-dependency of said work or structures, its availability for access by the general public, and the ownership of regulated structures or filled areas. If such information proves to be false, deceptive, incomplete or inaccurate, this certificate may be modified, suspended or revoked, and any unauthorized activities may be subject to enforcement action.
16. The Certificate Holder may not conduct work waterward of the high tide line or in tidal wetlands at this certificate site other than the work authorized herein, unless otherwise authorized by the Commissioner pursuant to CGS section 22a-359 et. seq. and/or CGS section 22a-28 et. seq.
17. The issuance of this certificate does not relieve the Certificate Holder of his obligations to obtain any other approvals required by applicable federal, state and local law.
18. Any document, including but not limited to any notice, which is required to be submitted to the Commissioner under this certificate shall be signed by the Certificate Holder and by the individual or individuals responsible for actually preparing such document, each of whom shall certify in writing as follows: "I have personally examined and am familiar with the information submitted in this document and all attachments and certify that based on reasonable investigation, including my inquiry of those individuals responsible for obtaining the information, the submitted information is true, accurate and complete to the best of my knowledge and belief, and I understand that any false statement made in this document or its attachments may be punishable as a criminal offense."
19. This certificate is subject to and does not derogate any present or future property rights or powers of the State of Connecticut, and conveys no property rights in real estate or material nor any exclusive privileges, and is further subject to any and all public and private rights and to any federal, state or local laws or regulations pertinent to the property or activity affected hereby.

Issued on June 4, 2012.

Certificate of Permission No. 201201271-KZ, Stratford, City of Bridgeport

PERMIT NOTICE

This Certifies that Authorization to perform work below the High Tide Line and/or within Tidal Wetlands of coastal, tidal, or navigable waters of Connecticut

Has been issued to: **City of Bridgeport**

At this location: **Sikorsky Memorial Airport, 1000
Great Meadow Drive**

To conduct the following: **remove a section of berm to restore tidal flow.**

Permit #: **201201271-KZ**

Issued on: **June 4, 2012**

This Authorization expires on: **June 4, 2017**

This Notice must be posted in a conspicuous place on the job during the entire project.

NOTES:

1. CONTAMINATED MATERIALS SHALL NOT BE STOCKPILED. IF ENCOUNTERED, CONTAMINATED MATERIALS SHALL BE STORED AND TRANSPORTED OFF-SITE IN ROLL-OFF CONTAINERS.
2. GROUND BELOW STOCKPILE SHALL BE DRY, STABLE, AND LEVEL.
3. STOCKPILE SHALL BE LOCATED A MINIMUM OF 100' FROM WETLANDS.
4. MAXIMUM SLOPE OF STOCKPILE SHALL BE 1:2.
5. STOCKPILE SHALL BE COVERED WHEN THE CONTRACTOR IS NOT ACTIVELY STOCKPILING MATERIAL.
6. STOCKPILED MATERIAL SHALL BE REMOVED FROM THE SITE AND LEGALLY DISPOSED OF PRIOR TO THE COMPLETION OF CONSTRUCTION ACTIVITIES. UPON REMOVAL OF STOCKPILE THE CONTRACTOR SHALL REGRADE, TOPSOIL, SEED AND MULCH THE DISTURBED AREA.

SEQUENCE OF CONSTRUCTION
TIDE GATE AND BERM REMOVAL

GENERAL

1. PRIOR TO THE START OF CONSTRUCTION, AREA TO BE EXCAVATED SHALL BE TESTED FOR CONTAMINATION. IF CONTAMINATED MATERIALS ARE FOUND WITHIN THE LIMITS OF EXCAVATION, THEY WILL BE PLACED IN ROLL-OFF CONTAINERS AND LEGALLY DISPOSED OF OFF-SITE IN ACCORDANCE WITH ALL APPLICABLE STATE AND FEDERAL REGULATIONS. WET CONTAMINATED SOILS WILL FIRST BE DEWATERED BY PLACING ON PLASTIC SHEETING SURROUNDED BY HAY BALES. CONTAMINATED WATER WILL BE COLLECTED IN 50 GALLON DRUMS AND PROPERLY DISPOSED OF OFF-SITE IN ACCORDANCE WITH APPLICABLE FEDERAL AND STATE REGULATIONS. STOCKPILING OF CONTAMINATED MATERIALS ON-SITE WILL NOT BE ALLOWED. ALL PERSONNEL INVOLVED IN EXCAVATING AND/OR HANDLING WASTE MATERIALS WILL HAVE RECEIVED HAZARDOUS WASTE TRAINING IN ACCORDANCE WITH OSHA 1910.120 REQUIREMENTS. COORDINATE WITH EPA AND CTDEEP PRIOR TO EXCAVATION.
2. ALL CONSTRUCTION SHALL BE SEQUENCED SO AS TO MINIMIZE THE DURATION OF CONSTRUCTION ACTIVITIES.
3. ALL MATERIALS REQUIRED FOR CONSTRUCTION SHALL BE ON SITE PRIOR TO THE START OF THE ACTIVITY TO AVOID CONSTRUCTION DELAYS DUE TO MATERIALS DELIVERY.
4. THE CONTRACTOR SHALL PROVIDE ADVANCED NOTIFICATION OF THE CONSTRUCTION SCHEDULE TO THE CITY OF BRIDGEPORT, TOWN OF STRATFORD, THE CONNECTICUT DEPARTMENT OF TRANSPORTATION, THE ARMY ENGINE PLANT, AND THE RESIDENTS LOCATED ALONG THE DRIVEWAY USED TO ACCESS THE WORK AREA.

SPECIFIC

1. INSTALL THE TURBIDITY CURTAIN BARRIERS UPSTREAM AND DOWNSTREAM OF THE TIDE GATE STRUCTURE.
2. WORK WILL BE CONDUCTED IN THE WET DURING LOW TIDE. A BACKHOE OR SMALL EXCAVATOR WILL BE USED TO EXCAVATE AND REMOVE TIDE GATE STRUCTURE. THE SURROUNDING BERM WILL BE REMOVED, AS NECESSARY, IN ORDER TO FACILITATE REMOVAL OF THE TIDE GATE. IT IS ANTICIPATED THE EXCAVATED AREA WILL BE UP TO 20 FEET WIDE, WITH A 3:1 SLOPE.
3. WET EXCAVATED SOILS WILL BE DEWATERED BY PLACING ON PLASTIC SHEETING SURROUNDED BY HAY BALES.
4. WORKING FROM SOUTH TO NORTH IN 10-15 FOOT INCREMENTS, EXCAVATE BERM AND PIPE TO 6 INCHES (MINIMUM) BELOW FINISHED GRADE. INSTALL SANDY LOAM TO FINISHED GRADE. WORK AT LOWEST ELEVATIONS SHALL BE PERFORMED AS NEAR TO LOW TIDE AS POSSIBLE. EXCAVATED MATERIAL WILL BE TRANSPORTED ALONG THE TOP OF THE EARTHEN BERM, TO THE GRAVEL DRIVEWAY, WHERE IT WILL THEN BE TAKEN AND STOCKPILED ON PLASTIC SHEETING. THE STOCKPILE WILL BE LOCATED ON AN UPLAND AREA ON AIRPORT PROPERTY APPROXIMATELY 500 FEET WEST OF THE EXCAVATION SITE. THE STOCKPILED SOIL WILL BE SURROUNDED BY HAY BALES STAKED IN PLACE.
5. STABILIZE ALL DISTURBED AREAS WITH BIODEGRADABLE MATTING.
6. REMOVE TURBIDITY CONTROL CURTAIN BARRIERS.
7. ALLOW RE-VEGETATION OF THE SITE TO OCCUR NATURALLY.

Subject: City of Bridgeport Sikorsky Memorial Airport, Marine Basin off Housatonic River located off property at 1000 Great Meadow Drive, Certificate of Permission #201201271-KZ

Pursuant to Section 22a-363g and Section 22a-363b of the Connecticut General Statutes, the Commissioner of Energy and Environmental Protection gives notice that a certificate has been issued to City of Bridgeport Sikorsky Memorial Airport:

1. remove an existing tidal gate and section of earthen berm located south of the existing gravel driveway located off Main Street, Route 113 as follows:
 - a. temporarily install a turbidity control curtain on the upstream and downstream sides of the area of removed earthen berm as shown on Figure 4., of the plans attached hereto;
 - b. excavate approximately 525 cubic yards of earthen fill including removal of an existing reinforced concrete tide gate structure and pipe over an approximately 6,000 square foot area to a depth of -2.0' NGVD for a 20 foot wide base with 3:1 side slopes terminating at elevation 5.75' NGVD;
 - c. place 6 inches of a sandy loam if required on the 3:1 side slopes to enhance tidal wetland plant growth and cover the side slopes with a biodegradable matting.

If you have any questions pertaining to this matter, please contact the Office of Long Island Sound Programs at 860-424-3626.

**Dredging Alternatives Evaluation
Stratford Army Engine Plant
Stratford, Connecticut**

1.0 Introduction

Lally Consulting LLC (Lally) was tasked by Wood PLC dba AMEC Foster Wheeler (AMEC FW) to conduct a feasibility-level alternatives evaluation of dredging technologies for remediation of the Stratford Army Engine Plant (SAEP) site. The findings of these analyses, including proposed suitable alternative dredging technologies, are provided in this report.

2.0 Site Assessment and Data Review

To become familiar with site conditions and constraints, a site visit was conducted by John Lally at the SAEP property in Stratford, Connecticut on October 6, 2017, along with AMEC FW representatives Tony Delano and Danielle Ahern. After an introduction of the SAEP's historical activities and current operations by site representative Richard Barlow, Tikigao Construction LLC, shoreside visual assessment was made of the areas targeted for sediment remediation, including the Intertidal Flats (tidal flats), and, to a lesser degree, the Outfall 008 Drainage Ditch. The tidal flats shoreline and intertidal areas were viewed from the Causeway and central shoreline during mid- and low tide. A portion of the Outfall 008 Drainage Ditch was viewed at its west end through a chain link fence. Also viewed were the site's upland features including parking lots, roadways and buildings, that can potentially be employed for project access, staging areas, dredged material transport, dewatering and water treatment activities, cap material storage, and dredged material placement/beneficial use. Several photographs taken during the site visit are provided in Appendix A.

Further assessment was made through review of available site information. Several data sets were provided by AMEC FW or accessed through the additional efforts of Lally. These data and information include;

- *Geotechnical Investigation Summary Causeway Non-time Critical Removal Action Design* (Harding, 2000);
- Preliminary chemical analytical data and mapping of contaminants across the SAEP tidal flats;
- Preliminary geotechnical testing results for samples collected August and October 2017;
- Preliminary treatability study results;
- Preliminary dredge area delineation across the SAEP tidal flats and Outfall-008 Drainage Ditch remediation areas;
- National Oceanic and Atmospheric Administration (NOAA) tide data;
- Housatonic River Federal Navigation Project, Draft Environmental Assessment. (USACE, 2012);
- Historical aerial photography.

2.1 Proposed Remediation Plan

To address the sediment in the tidal flats, which has been determined to contain varying concentrations of primarily mercury, metals and PCBs, AMEC FW has developed a preliminary remediation plan. The plan currently involves the removal by dredging of approximately 58 acres of tidal flats sediment to depths of 1 ft. to 4 ft. below mudline. This would represent approximately 140,000 cy of dredged material to neatline elevation. Following dredging to target elevations, the dredged areas are proposed to be backfilled with clean material (i.e. sand) to original grades.

2.2 Shoreline Structures

The SAEP tidal flats site extends approximately 2,700 ft. along the right descending bank of the Housatonic River, with the downstream boundary roughly 7,700 ft. from the terminus of the outer breakwater at the river's entrance.

To protect the plant and property from wave-induced erosion and flooding, a dike and armor rock revetment approximately 2,300 ft. in length was installed along the facility's boundary with the tidal flats.

In the 2000s, an erosion control cover system consisting of geogrid marine mattresses was placed over the Causeway to prevent possible receptor contact with contaminated soil and overland transport of contaminated soil into the tidal flats.

Where the west tidal flats meet the Housatonic River, a quarystone jetty extends approximately 1,200 ft. parallel with channel. The crest elevation of the jetty is set at approximately 0 ft. MSL.

Photos of the site setting, including these structures, are provided in Appendix A.

2.3 Sediment Characteristics

The physical characteristics of the surface sediments in the east and west tidal flats were observed from shore during the site visit to be dark brown silt with some sand and organic content. The sediments are generally very soft, exhibiting high water content and low bearing strength.

The report *Geotechnical Investigation Summary, Causeway Non-Time Critical Removal Action Design Stratford Army Engine Plant, Stratford, Connecticut* (Harding, 2000) documented the subsurface geotechnical characteristics of the Causeway for the purposes of designing the aforementioned erosion control cover system. Accordingly, most of the borings driven for the investigation were on the Causeway. Five (5) borings, however, GB-00-05, GB-00-06, GB-00-07, GB-00-08 and GB-00-09 were collected off the Causeway and provide an indication of the physical characteristics of the surface sediment to be encountered in the dredge prism. For this dredging evaluation, relevant physical characteristics were extracted from the report and boring logs and summarized in Table 1.

Table 1
Off-the-Causeway Sediment Physical Characteristics (from Harding, 2000)

Sample	Bed Surface Elevation (ft, MSL)	Field Description			USCS Group Symbol	SPT - N Value (Blows / Foot)
		0 - 2 ft. Below Surface	2 - 4 ft. Below Surface	4 - 6 ft. Below Surface		
GB-00-05	-1.9	Black mud flat muck, gritty w/ trace sand, trace silt, trace fiber, distinct hydrocarbon odors, non-plastic, very sticky, non-draining. PID=3	Black organic silt, trace fibers, trace shells, Sulphur odor, w/ slight organic odor, non-plastic, non-dilating, non-draining. PID=2.6	Vane Shear	MH	<1
GB-00-06	-1.7	Black organic silt. High Sulphur odor, very soft, some fibers - muck. PID=7	Blackish brown organic silt. Muck, high Sulphur odor, very soft, micaceous, w/ some plant fibers. PID=31	Vane Shear	OL	<1
GB-00-07	-2.7	Black silt, soft, non-plastic	Black silt, loose fine sand, non-plastic	Vane Shear		<1
GB-00-08	-1.3	Black muck, silt, very soft	Black to very gray silt, fine sand, muck, very soft	Fine sandy silt, wood, soft, trace peat, micaceous brown to gray	ML / OL	<1
GB-00-09	-2.1	No recovery	Black muck and silt. Very high Sulphur odor, very soft and sticky. PID =2	Black to very dark gray organic silt, micaceous - does not stick to fingers when squeezed, strong Sulphur odor. PID=7	OL	<1

As seen in the upper core intervals (0-2 ft., 2-4 ft., and 4-6 ft.), the surface layers of the tidal flats on either side of the Causeway are generally characterized as very soft, black to very dark gray organic silt, often with some sand, shell and fiber content.

Standard Penetration Test (SPT) sampling was performed with blow counts recorded for each 6-inch interval. At the 5 samples of interest off the Causeway, the blow counts were all weight of rod ($N < 1$) in the upper core segments.

Vane shear testing (VST) was also performed on some of these samples in the field to characterize the shear strength of near surface sediments. For the off the Causeway samples, VST was undertaken at sample locations GB-00-05, GB-00-06, GB-00-07, at the 4-6 ft. interval. Based on VST results and analysis, the average undrained shear strength for the off the Causeway sediment was estimated to be 180 psf, while the saturated unit weight was estimated at 94 pcf, 0 - 10 ft. below mudline.

Based on the field sampling results and lab testing, strengths for the organic sediments were seen to increase with depth. Water contents are also reported to increase with depth. This is likely due to the increased organic contents observed with depth. (Harding, 2000)

As reported, the tidal flats sediment exhibits a high Sulphur odor. Photoionization detector (PID) testing was conducted on many samples, which registered readings as high as 31 ppm in GB-00-06, for example.

More recent field investigations and laboratory testing were initiated by AMEC FW in summer 2017 to yield a greater understanding of the physical properties of the contaminated sediment inventory in support of feasibility study development. Two sampling events, on August 22nd and October 19th, 2017 were undertaken.

For the August event, sampling was focused in four (4) discrete areas associated with some of the highest contaminant concentrations on the tidal flats. These areas were selected primarily for treatability testing and waste characterization analysis. From several of the coring locations, samples were collected to develop a treatability composite sediment sample. Of this master composite sample, 59.9% was silt and clay, with 38.4% sand, and 1.7% gravel, with a description of sandy silt (MH). LL was 72, PL was 43, and the PI was 29. Bulk (wet) density was 90.3 pcf and dry density was 50.1 pcf. Specific gravity was 2.61. Percent solids was 55.5%. (AMEC FW, 2018)

In the October event, ten (10) additional samples were collected from locations across the site. Samples were collected from borings advanced to the proposed depth of dredging (either 1, 2, 3, or 4 ft. below mudline) and composited across the depth of the recovered core. The October site-wide samples are more useful in assessing variability spatially and vertically across the site. A summary of the site-wide results is provided in Table 2.

For the ten (10) site-wide samples, silt content ranges from 17 to 66% and clay content ranges from 4 to 20%. Sand content ranges from 16.5 to 71.9% and descriptions include silt, silt with sand, sandy silt, and silty sand (MH, SM, and SM/ML). One sample was non-plastic. For plastic samples, LL ranged from 36 to 82, PL ranged from 33 to 41, and the PI ranged from 3 to 41. Bulk (wet) densities range from 81.5 to 112.5 pounds per cubic foot (pcf) and dry density ranges from 34.8 to 85.4 pcf. Specific gravity ranges from 2.5 to 2.68. Percent solids range from 50.4 to 75.9% and organic carbon ranges from 0.3 to 1.98%. (AMEC FW, 2018)

The results for the site-wide samples averaged 61.3% silt and clay, with 35.6% sand, and 0.9% gravel, with a description of sandy silt (MH). LL was 59.9, PL was 36.9, and the PI was 23. Bulk (wet) density was 101.1 pcf and dry density was 62.8 pcf. Specific gravity was 2.65. Percent solids was 61.6%. These results appear to provide a reasonable representation of overall geotechnical conditions at the site.

Data extracted from Preliminary Summary of Geotechnical Laboratory Testing Data (AMEC FW, 2018)
 pcf = pounds per cubic foot, LL = liquid limit; PL = plastic limit; PI = plasticity index; LI = liquidity index
 ASTM clay size particles are 0.005 mm or smaller and silt sized particles are 0.075 mm to 0.005 mm.
 Hydrometer results have not yet been provided by the laboratory.

Debris, shellfish, organic matter, marsh grasses, etc. should also be characterized and accounted for in dredge and processing system design. Based on initial visual assessment, debris potentially to be encountered consists of loose riprap near the toe of the revetment and jetty, marsh grasses located along the western and southeastern shorelines of the tidal flat, and bivalves and mollusks within the sediment matrix. Anthropogenic debris from SAEP operations is unlikely to be encountered according to site personnel familiar with historic operations, but possible. One isolated pile of riprap was observed at roughly the - 3.5 ft. MSL contour in the east tide flat just off the Causeway that may require removal.

2.4 Bathymetry

The bathymetry of the tidal flats remediation area ranges from approximately 0.0 ft. MSL near the toe of the rock revetment, to -10 ft. MSL just channelward of the Causeway. The slope is gently sloping to flat across most of the tidal flats, with an average depth of roughly -2.0 ft. MSL on the west flat, and -3.0 ft. MSL on the east flat. Three primary rivulets (on the west flat) and many smaller rivulets drain the marshes and tidal flats.

2.5 Water Levels

Tides at the site are semi-diurnal, that is with two nearly equal high tides and low tides every lunar day (roughly 24 hours and 50 minutes). Tidal datums applicable to the project site were obtained from NOAA Tide Station 8467150, Bridgeport, the closest harmonic station to the project site. The tidal datums, with elevations converted from the station datum (NAVD88) to MLLW and MSL (project vertical datum), are provided in Table 3. Historic extreme water levels are also provided in Table 3.

Table 3
Water Level Data based on NOAA Tide Station 8467150

Water Level Data: NOAA Station 8467150 Bridgeport, CT	Elevation (ft., NAVD88)	Elevation (ft., MLLW)	Elevation (ft., MSL)
Mean Higher High Water (MHHW)	9.30	7.32	3.70
Mean High Water (MHW)	8.97	6.99	3.37
Mean Tide Level (MTL)	5.59	3.61	-0.01
Mean Sea Level (MSL)	5.6	3.62	0.00
Mean Low Water (MLW)	2.22	0.24	-3.38
Mean Lower-Low Water (MLLW)	1.98	0.00	-3.62
North American Vertical Datum of 1988 (NAVD88)	0.00	-1.98	-5.60
Highest Observed Water Level (Oct. 30, 2012)	15.02	13.04	9.42
Lowest Observed Water Level (Feb. 2, 1976)	-2.60	-4.58	-8.20

2.6 Wave Climate

The lower Housatonic River estuary near its confluence with Long Island Sound is generally protected from long period swell. The longest fetch distance over which wind-waves incident to the SAEP tide flats can form is slightly over a mile. Vessel wakes from heavy boat traffic in the adjacent navigation channel can generate wave energy across the tidal flats as well. In either case, it is unlikely that wave heights exceed 1.5 ft. and wavelengths exceed 10 ft.

3.0 Dredging Alternatives Evaluation

Informed by the site visit, preliminary geotechnical characterization, and initial physical processes evaluation, a shortlist of dredging technologies are proposed and evaluated in this section.

3.1 Key Considerations

3.1.1 Dredgeability

With regards to the dredgeability of the tidal flats surface sediments, the following observations are made based on the initial characterization information and prior experience;

- The material is diggable using hydraulic or mechanical dredging technology,
- The material is transportable by both hydraulic slurry pipeline or barge,
- The presence of clay provides for possible impacts to hydraulic slurry transport and mechanical dewatering processes,
- The potential for resuspension and residuals generation is considerable,
- The material does not have adequate bearing capacity to support terrestrial excavation/hauling equipment with or without matting, *in situ* conditions,
- The sediments do not appear suitable for in-place dewatering and excavation “in the dry”.

3.1.2 Production

The shallowness and expansiveness of the tidal flats site will limit access, and the size and production capacity of the dredging equipment to be employed. The site’s tidal regime will greatly influence remedial design decisions and the dredge production rates and cleanup efficiency to be achieved during construction implementation.

Based on the existing bathymetry, 0.0 ft. MSL provides an approximate elevation at which shallow draft dredging plant will be able to begin productively working the tidal flats. A tides analysis was developed to provide an idea of the time available above 0.0 ft MSL. The analysis was run for a typical construction window of 0600 hrs. - 1800 hrs. The percentage of time and average available hours per day above specific tide elevations is summarized in Table 4.

Table 4
Floating Plant Working Tides Analysis (based on NOAA Station Bridgeport, CT)

Tide Elevation (ft., MSL)	Average Hours above / Day	% Time above / Day
4.0	0.2	2%
3.0	1.7	15%
2.0	3.4	29%
1.0	4.3	36%
0.0	4.9	41%

Based on the analysis, for approximately 5 hours per day tide elevations will provide adequate flotation for dredging with shallow draft equipment (<3 ft.). While much of the time these working high tides would be continuous within a 12-hr work day, oftentimes they are split between early morning and late afternoon, which would further impact production efficiency. During lower tides the dredging equipment could be productive in deeper areas along the northern slopes of the tidal flats.

3.1.3 Accuracy

Measured at approximately 58 acres, the tidal flats site would significantly benefit from the application of precision dredging equipment, to minimize the unnecessary removal, transportation and processing of clean underlying sediments. To underscore the importance of dredging accuracy, Table 5 was developed to provide a simple estimate of realistic overdredge performance values for the SAEP tidal flats site, and associated volume and cost implications. The estimate assumes a total unit cost of \$400/CY for dredging, processing and T&D, based on recent experience at other remedial dredging sites.

Table 5
Implications of Dredging Accuracy on Volume and Cost

SAEP Tide Flats Dredge Area (Acres)	SAEP Tide Flats Dredge Area (ft ²)	Overdredge (ft)	Overdredge Volume (ft ³)	Overdredge Volume (CY)	\$/CY	Cost
58	2,526,000	0.1	252,600	9,000	\$400	\$3,600,000
		0.2	505,200	19,000		\$7,600,000
		0.5	1,263,000	47,000		\$18,800,000
		1.0	2,526,000	94,000		\$37,600,000

As can be seen from these order of magnitude examples, there are significant cost and schedule implications driven by dredging accuracy performance. Accordingly, precision variants of both hydraulic and mechanical dredges are proposed for this project, as discussed below.

3.1.4 Resuspension and Residuals

To achieve cleanup goals cost effectively, dredging plant, support equipment and approaches should be applied to the SAEP site that minimize the generation of residual contamination. Both generated residuals and undredged inventory can lead to excessive, and expensive, returns to areas not meeting cleanup criteria. There can be many causes of generated residuals, including loss at the cutterhead / clamshell bucket, propwash, and sloughing. Undredged inventory is often a function of how accurately the contaminated inventory was sampled and delineated in the horizontal and vertical extent, modeled, and how effectively the dredge prism was designed.

Similarly, to meet project water quality requirements, and possibly allow for expanded construction windows, dredging plant, support equipment and approaches should be applied to the SAEP site that create minimal resuspension.

Table 6 was developed to summarize the resuspension and residuals generation ‘footprint’ of the proposed dredging alternatives, by operation.

3.1.5 Engineering Controls

It is appropriate to consider the need for engineering controls at this stage as they relate to the evaluation of dredging alternatives and project planning.

3.1.5.1 Cofferdam

A steel sheet pile cellular cofferdam extending from the shore connection of the jetty to the eastern boundary of east tidal flat could effectively isolate the tidal flats dredging areas from the Housatonic River during construction. Isolation of the dredging area by cofferdam allows for consideration of;

- Performing sediment removal in-the-dry, or
- Performing dredging with constant flotation, and
- Preventing water quality impacts outside the project.

As reported in the *Geotechnical Investigation Summary* (Harding, 2000), the water contents in the sediments increase with depth, which makes the prospect of in-place dewatering and excavation in-the-dry difficult. Possibly more feasible through construction of the cofferdam would be maintaining a constant water surface elevation over the dredge areas to provide adequate flotation at all times. This would allow for optimal dredging production, accuracy and residuals management by the floating dredge operation. Lastly, a cofferdam would allow for the isolation of the dredging project, and consequential water quality impacts during construction, from the Housatonic River estuary. This could open the possibility of dredging year-round and not being subject to environmental windows.

The potential advantages of the cofferdam described above are worth considering during the feasibility and remedial design stages and will need to be balanced against the cost of the installation and any impacts during and following construction. One other consideration would be the increase in flooding potential along adjacent shoreline properties caused by an ongoing high water surface elevation and storm-induced wind-waves. Accordingly, and based on detailed analysis of tidal flats shoreline topography, the cofferdam engineering control should not create a pool elevation exceeding a typical high tide elevation (i.e. MHW, or MHHW).

3.1.5.2 Wave Attenuator

To reduce potential impacts incident wind-waves and vessel wakes may have on dredging operations while underway in the tidal flats, a floating wave attenuator could be installed at strategic segments of the opening between the jetty and Causeway, and Causeway and eastern project shoreline. Again, the potential benefits in terms of production gains would need to be compared to the costs of installation and maintenance. It would also be important to consider that the larger, heavier dredge platforms would be less impacted by waves than the smaller plant.

3.1.5.3 Turbidity Curtain

The use of silt curtains and turbidity curtains to manage water quality impacts from dredging and support operations is common at contaminated sediment sites. For the SAEP tidal flats site it is anticipated that a Type II or Type III full length curtain could be required to contain plumes and manage

water quality and release to adjacent waters. The alignment and depth of the curtain will need to be determined to meet agency requirements and accommodate dredging operations. It's possible the curtain would need to enclose a large area, i.e. between the jetty and eastern project shoreline, and accommodate a large tidal flux. A solid understanding of the tidal regime, including velocities, is suggested.

3.2 Alternative Dredging Technologies

Informed by an initial understanding of site conditions, likely processing and disposal scenarios, and experience, a shortlist of five (5) dredging technologies are proposed as likely suitable alternatives to complete the SAEP dredging work;

- Hydraulic Swinging Ladder Cutterhead Dredge
- Precision (Mechanical) Excavator Dredge - Hydraulic Transport
- Precision (Mechanical) Excavator Dredge - Shallow Draft Barge Transport
- Amphibious Dredge (Mechanical / Hydraulic)
- Long Reach (Terrestrial) Excavator

Most of these dredging technologies have been demonstrated to be effective on other contaminated sediment sites and show potential for successful application on the conditions the SAEP tide flats site presents, to a degree they are evaluated here. Photos of each technology are provided in Appendix B.

3.2.1 Alternative 1 - Hydraulic Swinging Ladder Cutterhead Dredge

A hydraulic swinging ladder cutter suction dredge in the 8-in class is proposed as an appropriately sized and functioning shallow draft hydraulic pipeline dredge for the SAEP tidal flats.

The Dredge Supply Company (DSC) Moray SL and Ellicott 360 SL are versions of swinging ladder dredge, both 8-in discharge, with similar pumping characteristics, that are suitable for a shallow dredge cuts, pipeline conveyance over long distances, and feeding mechanical dewatering systems. The Moray has been used on more sediment remediation projects than the 360SL, in part likely due to customizations to their base model dredges for specific applications (i.e. shallow draft, precision cutting, and higher % solids). That said, the Ellicott 360 swinging ladder dredge has also been adapting to the needs of environmental dredging projects.

The swinging ladder dredge spuds down to stabilize the dredge platform while dredging, for improved accuracy, steadier state cutting and slurry concentrations, and consistent lane advance. Horizontal positioning is good, better than +/- 2 ft. typically, in using the walking spud system to advance in small increments (generally about one cutterhead width), before lowering the spuds again, to create a stable platform from which to swing the ladder and cutterhead. Both the Moray and 360SL can be operated in either swinging ladder mode, which swings that ladder and cutterhead into the bank whilst the barge is held stationary; or in conventional mode, where the entire dredge platform pivots off its stern spud. Conventional mode allows for wider swing widths, to about 40 ft., while swinging ladder provides closer to a 20 ft. swing width depending on pontoon configuration and ladder length and depth.

The dredges' cutterheads are designed to agitate and draw the targeted bank material closer to the influence of the suction intake immediately behind the cutter on the ladder. Options in cutterhead design, for improved accuracy, higher % solids, and reduced residuals, have been developed for the Moray dredge. Also, to orient the cutterhead and suction level with the cut bank to promote improved accuracy and higher solids, articulated ladders are available for both the Moray SL and 360 SL.

On a recent visit to the Lower Fox River project in Green Bay, Wisconsin the performance of swinging ladder dredge operations was observed. Three hydraulic dredges, including one (1) 12-in and two (2) 8-in swinging ladder dredges were being employed on the project to remove and transport PCB-contaminated sediment up to 10 miles to the project's sediment processing facility. System capacity is 6,500 GPM, with typical operating discharge of 5,000-6,000 GPM combined from the three dredges. The 8-in DSC Moray dredges, was producing on the order 25-30 cy/hr in high bank material, and as low as 5 cy/hr or less in thin face - cleanup pass mode. Corresponding slurry concentrations are reported to range from 8%-12% solids by weight for thick faces down to 2%-4% solids by weight for thin faces – cleanup passes. Dredging efficiencies (effective time) was reportedly maintained at 80% - 90%.

The Moray dredges can draw as little 1.5-2.0 ft and use both conventional and modified pontoons for shallow water operations. The contractor on the Fox River employs, and in some cases developed, several different cutter attachments, including the conventional rotating basket cutter for denser and thicker material, an environmental disk cutter, as well as a specialized straight vacuum for unconsolidated, high water content material removal overlying stiffer substrates. The Moray dredge is essentially self-propelled in lane advances through use of the kicker (traveling) spud. Project-averaged vertical dredging accuracies are reported to be 0.4-0.5 ft. using installed RTK-GPS and electronic dredge positioning system.

Conceptually, for the SAEP tidal flat project, one (1) or two (2) 8-in swinging ladder dredge systems, which are truckable, could be transported to the project site, and lifted or floated into the Housatonic or possibly mobilized off the Causeway. Depending on the required feed characteristics of the project dewatering system, and to optimize production, accuracy, and residuals management performance, it may be advisable to include automation controls (i.e. swing speed, cutter speed, flow rate) and a site-specific cutterhead design to minimize spillage and resuspension. The dredge would also be instrumented with RTK-GPS and dredge positioning and guidance system to implement a final, potentially tighter tolerance dredging plan. Shallower draft pontoons, articulated ladders, and advanced spud systems would also be considered as potential cost savings measures on a swinging ladder dredging alternative. Developing an operations plan that would leverage the swinging ladder's dredge pattern, to achieve cleanup with the greatest efficiency, would be done at the design phase.

3.2.2 Alternative 2 - Precision (Mechanical) Excavator Dredge - Shallow Draft Barge Transport

Based on prior experience with both hydraulic and mechanical dredge types, precision excavator dredges coupled with a latest generation level-cut sealed environmental clamshell bucket can offer the best available performance on contaminated sediment remediation sites in most key categories, including dredging accuracy, production, solids concentrations, and residuals management. These platforms are also versatile in their ability to easily convert to capping operations.

For shallower sites like the SAEP tide flats, the precision excavator dredges can be constructed on site by fabricating a barge platform, typically of modular barges (i.e. Flexifloat), lifting on deck plant (spud and winches/drums, genset, control rooms, etc.) with a shore-based crane, then rolling on the excavator.

The excavator is instrumented with RTK-DGPS and a dredge and bucket positioning system (DBPS), using a series of angle sensors (inclinometers) and rotation sensors mounted on the machine, boom, stick, and bucket for precise location and monitoring of the dredge and bucket. Operating from a relatively stable platform with 2-4 spuds, precision dredging, to better than 2-in. vertically, is achieved by placing the cutting edge of the bucket to target elevations monitored via a real-time heads-up display. For sites with high cost for T&D, use of the +/- 1-in. variance or better level-cut clamshell buckets is warranted to minimize further 'scallop' cuts into non-target sediments. Dredging progresses in defined set patterns, with consistent grab thicknesses and overlap to manage residuals and maintain planned production rates. For optimal solids concentrations and production rates, bucket grabs with consistently high fill efficiency are made. Barges provide the ability to transport dredge materials at highest possible solids concentrations, with the only water added that which is entrained in the bucket. To a large degree, clamshell buckets can also contend with debris better than hydraulic dredging systems.

Another potential advantage of mechanical dredging is the ability to leverage a 'visual' dredging approach. Developed on New Bedford Harbor during the Pre-Design Field Test in 2000, with the first excavator-mounted level-cut clamshell bucket used in the United States, this is the ability to make real time visual assessments of the material being dredged, to inform and tune core-based dredge target elevations. This approach is feasible where the contact between the contaminated inventory and 'clean' native material can be distinguished, either by color or consistency. Based on review of initial core logs from the east and west flat, the surface layers are predominantly homogenous black to dark gray organic silt (muck), very soft, with no distinguishing contact with native. The ability to apply the aforementioned approach in this case thus far appears limited.

For either the mechanical excavator with barge transport approach, or hybrid mechanical excavator – hydraulic transport approach, described in the next section, it is conceptualized that one (1) or two (2) shallow draft precision excavator dredges, would be employed to be able to work the tides efficiently, i.e. one working the east flat and one the west flat, or two working the west flat. These would use something like a CAT 3049MH long reach material handler or similar class excavator to operate an approximate 3.0 cy sealed level-cut environmental clamshell bucket. Deck barge platforms would be configured to provide greater flotation for optimal dredging production in the shallow conditions the tidal flats present. It is envisioned Flexifloat S-50 modular barges, which are 5 ft. high, would be used in the deck barge fabrication. Lane advances (stepping) and moves between areas would be accomplished using either an anchor and wire system or shallow draft push boat. These determinations would be based on balancing access, production, and residuals management on the tidal flats, while not sacrificing realized dredging accuracy.

To accommodate anticipated dredge production rates, depth limitations, and transport the mechanically dredge sediments from the point of dredging to shore, shallow draft barges would be needed for the mechanical dredging operations. Conceptually the barges would have capacities of roughly 60 cy, and not draw more than about 3 ft. To move the barges, shallow draft, truckable push boats would be employed. It is recognized that the push boats would be sources of resuspension, and their design and operations will need to be planned and managed carefully to keep water quality and residuals generation within acceptable ranges.

Another component that would need to be addressed with a mechanical dredging alternative (no hydraulic pipeline) at the SAEP, is transloading of dredged sediments to the presumed mechanical dewatering facility (i.e. east parking lot.). A likely scenario to transload dredged sediments under precision excavator and barge alternative would be to build a barge offloading area (BOA) on either the

northwest or northeast corner of the Causeway, or, near the channelside shore connection of the jetty. This would require construction of a pier-trestle capable of supporting a hydraulic offloader system and/or material offloading crane. Once installed, the BOA could be used for other site activities, including potentially residual cover and capping material conveyance to capping barges.

3.2.3 Alternative 3 - Precision (Mechanical) Excavator Dredge - Hydraulic Transport

This alternative combines the benefits of precision excavator dredging and hydraulic pipeline transport. Advantages and limitations are essentially the same as described for the precision excavator in the prior section. By the hybrid dredging approach, mechanical excavation removes material with a high degree of accuracy, typically better than 2-in below target elevation on average, at close to *in situ* concentrations, and places it in a hopper on board the dredge for initial screening of larger debris. Material that passes the debris screen, or grizzly, is slurried via a high efficiency, automated pump, with just enough makeup water to transport the material at maximum practical and steady-state concentrations. The makeup water can be sourced from a seachest along the dredge rail, or recirculated. The dredge material slurry would be received and processed in the same manner as hydraulically dredged sediment, at a presumed mechanical dewatering facility at the SAEP east parking lot.

During a pilot study in New Bedford Harbor in 2000, production averaged approximately 80 cy/hr, in deeper water, vertical dredging accuracy exceeded +/- 0.4 ft. with an average overdredge of -0.1 to -0.2 ft. below target elevation for the test area, and the visual dredging method was developed and applied to make real-time adjustments to the dredge plan. A similar system and approach has recently been setup at New Bedford and starting to achieve similar results, with improved accuracies. Additional details on the hybrid dredge system, can be reviewed in the Pre-Design Field Test study report, <https://www3.epa.gov/region1/superfund/sites/newbedford/23751.pdf>.

3.2.4 Alternative 4 - Amphibious Excavator

There are many variants of amphibious dredges, both mechanical and hydraulic. Mechanical models such as the Wilco marsh buggy are conventional excavator machines mounted on custom floating or low ground pressure (LGP) tracked pontoons. Hydraulic amphibious dredges such as the Amphibex or Waterking, use large sponsons and kicking spuds to traverse over ground. These platforms are also convertible to mechanical dredging mode.

While the production rates and accuracy of these dredges are not as high as Alternatives 1-3, the concept of employing amphibious dredges from floating to emergent conditions, to remain productive in the intertidal areas over the full tidal cycle, is attractive for this site. What would present a distinct disadvantage for these dredge types, however, is the problem of residuals generation and recontamination. Interaction of the tracks in the case of the marsh buggy and its support equipment (i.e. LGP trucks), or of the barge and sponsons in the case of the Amphibex type, would significantly disturb the bed surface, and cause mixing such that a 'clean' and organized removal sequencing would be difficult to achieve.

Examples of amphibious dredge types are provided in Figures 7 and 8 of Appendix B.

3.2.5 Alternative 5 - Long Reach (Terrestrial) Excavator

A long-reach excavator operated from stable ground close to the water's edge for the mechanical removal of near shore sediments is likely a suitable approach and cost effective for much of SAEP sediment site. Mechanically dredged material removed at close to *in situ* concentrations can provide savings in processing and disposal costs. Elimination of some of the shallowest areas, or areas where shoreline debris content may be high would also yield savings versus applying floating plant. Given the preliminary design slopes, a long reach excavator would also be a preferred technology for sediment removal and basin contouring in the Outfall 008 Drainage Ditch.

Long reach excavators are available from several manufacturers with various boom and stick configurations and aftermarket attachments. Reaches can extent to about 70 ft. from kingpin along the digging envelope. Smooth lipped, open faced buckets are typically used, however, with proper lifting capacity calculations, a sealed, level-cut clamshell bucket may be better applied, particularly if removing soft, high water content sediments, and on the tidal flats. An open bucket may be required in the Outfall 008 Drainage Ditch to accomplish slope sculpting. In either case, the dredged materials could be placed in dump trucks and presumably hauled to an onsite stabilization or processing facility.

Examples of long reach excavators working on shoreline and canal projects are provided in Figures 9 and 10 of Appendix B.

3.3 Summary

Specifications and estimated performance characteristics for the five alternative dredging technologies evaluated for this site are summarized in Table 6. Table 7 has been developed to provide the resuspension and residuals generation 'footprint' of each alternative, by operation. Table 7 does not yet attempt to quantify the various source mechanisms, nor propose mitigation measures or best management practices, of which there are many.

Based on the evaluations conducted, recommendation is made to retain Alternatives 1, 2, 3 and 5 for possible application on the SAEP project. To make a final determination on which technology or combination of technologies would be most effective in achieving project goals, detailed production and cost estimates for each system should be developed, cleanup goals better understood (i.e. backfilling to be carried out or not), and the site's dredged material disposal / beneficial use alternatives assessed further.

The estimates should incorporate reasonable performance value assumptions for production rates, dredging accuracy, equipment costs, added water, as well as construction schedules to assess the overall project cost for each dredging alternative. With this knowledge, determination of the most cost-effective dredging approach can be made, and developed during the remedial design phase.

CUTTER SUCTION DREDGE , SWINGING LADDER, HYDRAULIC TRANSPORT	Alternative 2 PRECISION MECHANICAL DREDGE - SHALLOW DRAFT BARGE TRANSPORT	Alternative 3 HYBRID - PRECISION MECHANICAL DREDGE / HYDRAULIC TRANSPORT	Alternative 4 AMPHIBIOUS DREDGE (MECHANICAL / HYDRAULIC)	Alternative 5 LONG REACH TERRESTRIAL EXCAVATOR
Anchor System	No anchor system required in swinging ladder mode. When dredging in conventional mode, to achieve wider cuts, an anchor and wire system is used to swing entire dredge. On SAEP a 3- or 4- wire system deployed up to 500 ft fore-aft and side-side of dredge, using shore connections when possible. Anchor setting and removal, with propwash and potential groundings of work boat and A-frame, and interaction of wires with bed, can cause resuspension and residuals.	No anchor system required for mechanical dredging operations, however may be used to optimize access and production in shallow tide dependent areas of the SAEP. Likely a 3- or 4-point wire system could make use of shore anchors when possible. Anchor setting and removal, with propwash and potential groundings of work boat and A-frame, and interaction of wires with bed, can cause resuspension and residuals.	Anchor and wire system may be advisable for hybrid dredge to optimize access and production in shallows tidal dependent areas of the SAEP, likely a 4- or 5-point wire system could make use of shore anchors when possible. Anchor setting and removal, with propwash and potential groundings of work boat and A-frame, and interaction of wires with bed, can cause resuspension and residuals.	Anchor and wire system not suitable for amphibious dredge types.	N/A, land-based
Point of Dredging	Overloading of pump suction results in plowing, loss, and generated residuals. Overpenetration and mixing generates residuals and disturbed inventory. Evacuation of sediment slurry in discharge pipeline back to harbor to clear pump of debris, backflushing, and clearing plugged pipelines generates resuspension and residual contamination. Potential for grounding.	Resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure through cycle to barge placement when bucket not sealed completely, or overfilled. Potential to cause generated residuals and undredged inventory if proper bucket overlap not achieved. Potential for grounding.	Resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure through cycle to barge placement when bucket not sealed completely, or overfilled. Potential to cause generated residuals and undredged inventory if proper bucket overlap not achieved. Potential for grounding.	Grounding and traversing over bed surface is inherent in these dredge types. Significant residuals and resuspension likely. In addition, overloading of pump suction results in plowing, loss, and generated residuals. Overpenetration and mixing generates residuals and disturbed inventory. Evacuation of sediment slurry in discharge pipeline back to harbor to clear pump of debris, backflushing, and clearing plugged pipelines generates resuspension and residual contamination. In mechanical mode resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure or open face bucket.	Resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure or open face bucket.
Material Transport	Submerged and floating discharge pipeline interaction with bed surface. Periodic barge transits needed to transfer debris to shore.	Propwash and potential groundings from shallow draft barge operations. Barge transits from the dredges to the barge offloading area (BOA), oftentimes working the tides and with possibly less than 1 ft unkeel clearance.	Submerged and floating discharge pipeline interaction with bed surface. Periodic barge transits needed to transfer debris to shore.	By hydraulic method, submerged and floating discharge pipeline interaction with bed surface. Periodic barge transits needed to transfer debris to shore. By mechanical method LGP truck may be required, which would cause significant residuals. Propwash and potential groundings from shallow draft barge operations. Barge transits from the dredges to the barge offloading area (BOA).	N/A, land-based
Positioning and Lane Advance	Typically 1-2 passes required per 1 ft bank of material to remove. Uses traveling (kicker) spud to step forward in uniform increments, typically one cutterhead width. Each step requires resetting of the three (3) 8-in square spuds.	Typically 1 pass required per 1-2 ft bank of material to remove. Uses two (2) 20-in spuds to position dredge. Lane advance can be achieved by traveling spud, push boat assist, or anchor/wire, each with potential to generate resuspension and residual generation potential.	Typically 1 pass required per 1-2 ft bank of material to remove. Uses two (2) 20-in spuds to position dredge. Lane advance can be achieved by traveling spud, push boat assist, or anchor/wire, each with potential to generate resuspension and residual generation potential.	Typically 1 pass required per 1-2 ft bank of material to remove. Uses two (2) 8-10 in. spuds to position. Lane advance can be achieved by traveling spud, outboards, push boat assist, or tracking over bed surface, each generate resuspension and residuals.	N/A, land-based
Move between Areas	Moving dredges between areas upon completing an area, to accommodate bathy surveys and verification sampling, or working the tides. Propeller wash from work boats and pipeline moves creates resuspension and potentially residuals.	Moving dredges between areas upon completing an area, to accommodate bathy surveys and verification sampling, or working the tides. Propeller wash from work boats create resuspension and potentially residuals.	Moving dredges between areas upon completing an area, to accommodate bathy surveys and verification sampling, or working the tides. Propeller wash from work boats and pipeline moves creates resuspension and potentially residuals.	Movements achieved by traveling spud, outboards, push boat assist, or tracking over bed surface, each generate resuspension and residuals.	N/A, land-based
Debris Management	Separate debris removal operation may be required, but not foreseen on SAEP.	Separate debris removal step not anticipated.	Separate debris removal step not anticipated.	Separate debris removal step not anticipated.	Separate debris removal step not anticipated.

**Dredging Alternatives Evaluation
Stratford Army Engine Plant
Stratford, Connecticut**

1.0 Introduction

Lally Consulting LLC (Lally) was tasked by Wood PLC dba AMEC Foster Wheeler (AMEC FW) to conduct a feasibility-level alternatives evaluation of dredging technologies for remediation of the Stratford Army Engine Plant (SAEP) site. The findings of these analyses, including proposed suitable alternative dredging technologies, are provided in this report.

2.0 Site Assessment and Data Review

To become familiar with site conditions and constraints, a site visit was conducted by John Lally at the SAEP property in Stratford, Connecticut on October 6, 2017, along with AMEC FW representatives Tony Delano and Danielle Ahern. After an introduction of the SAEP's historical activities and current operations by site representative Richard Barlow, Tikigao Construction LLC, shoreside visual assessment was made of the areas targeted for sediment remediation, including the Intertidal Flats (tidal flats), and, to a lesser degree, the Outfall 008 Drainage Ditch. The tidal flats shoreline and intertidal areas were viewed from the Causeway and central shoreline during mid- and low tide. A portion of the Outfall 008 Drainage Ditch was viewed at its west end through a chain link fence. Also viewed were the site's upland features including parking lots, roadways and buildings, that can potentially be employed for project access, staging areas, dredged material transport, dewatering and water treatment activities, cap material storage, and dredged material placement/beneficial use. Several photographs taken during the site visit are provided in Appendix A.

Further assessment was made through review of available site information. Several data sets were provided by AMEC FW or accessed through the additional efforts of Lally. These data and information include;

- *Geotechnical Investigation Summary Causeway Non-time Critical Removal Action Design* (Harding, 2000);
- Preliminary chemical analytical data and mapping of contaminants across the SAEP tidal flats;
- Preliminary geotechnical testing results for samples collected August and October 2017;
- Preliminary treatability study results;
- Preliminary dredge area delineation across the SAEP tidal flats and Outfall-008 Drainage Ditch remediation areas;
- National Oceanic and Atmospheric Administration (NOAA) tide data;
- Housatonic River Federal Navigation Project, Draft Environmental Assessment. (USACE, 2012);
- Historical aerial photography.

2.1 Proposed Remediation Plan

To address the sediment in the tidal flats, which has been determined to contain varying concentrations of primarily mercury, metals and PCBs, AMEC FW has developed a preliminary remediation plan. The plan currently involves the removal by dredging of approximately 58 acres of tidal flats sediment to depths of 1 ft. to 4 ft. below mudline. This would represent approximately 140,000 cy of dredged material to neatline elevation. Following dredging to target elevations, the dredged areas are proposed to be backfilled with clean material (i.e. sand) to original grades.

2.2 Shoreline Structures

The SAEP tidal flats site extends approximately 2,700 ft. along the right descending bank of the Housatonic River, with the downstream boundary roughly 7,700 ft. from the terminus of the outer breakwater at the river's entrance.

To protect the plant and property from wave-induced erosion and flooding, a dike and armor rock revetment approximately 2,300 ft. in length was installed along the facility's boundary with the tidal flats.

In the 2000s, an erosion control cover system consisting of geogrid marine mattresses was placed over the Causeway to prevent possible receptor contact with contaminated soil and overland transport of contaminated soil into the tidal flats.

Where the west tidal flats meet the Housatonic River, a quarystone jetty extends approximately 1,200 ft. parallel with channel. The crest elevation of the jetty is set at approximately 0 ft. MSL.

Photos of the site setting, including these structures, are provided in Appendix A.

2.3 Sediment Characteristics

The physical characteristics of the surface sediments in the east and west tidal flats were observed from shore during the site visit to be dark brown silt with some sand and organic content. The sediments are generally very soft, exhibiting high water content and low bearing strength.

The report *Geotechnical Investigation Summary, Causeway Non-Time Critical Removal Action Design Stratford Army Engine Plant, Stratford, Connecticut* (Harding, 2000) documented the subsurface geotechnical characteristics of the Causeway for the purposes of designing the aforementioned erosion control cover system. Accordingly, most of the borings driven for the investigation were on the Causeway. Five (5) borings, however, GB-00-05, GB-00-06, GB-00-07, GB-00-08 and GB-00-09 were collected off the Causeway and provide an indication of the physical characteristics of the surface sediment to be encountered in the dredge prism. For this dredging evaluation, relevant physical characteristics were extracted from the report and boring logs and summarized in Table 1.

Table 1
Off-the-Causeway Sediment Physical Characteristics (from Harding, 2000)

Sample	Bed Surface Elevation (ft, MSL)	Field Description			USCS Group Symbol	SPT - N Value (Blows / Foot)
		0 - 2 ft. Below Surface	2 - 4 ft. Below Surface	4 - 6 ft. Below Surface		
GB-00-05	-1.9	Black mud flat muck, gritty w/ trace sand, trace silt, trace fiber, distinct hydrocarbon odors, non-plastic, very sticky, non-draining. PID=3	Black organic silt, trace fibers, trace shells, Sulphur odor, w/ slight organic odor, non-plastic, non-dilating, non-draining. PID=2.6	Vane Shear	MH	<1
GB-00-06	-1.7	Black organic silt. High Sulphur odor, very soft, some fibers - muck. PID=7	Blackish brown organic silt. Muck, high Sulphur odor, very soft, micaceous, w/ some plant fibers. PID=31	Vane Shear	OL	<1
GB-00-07	-2.7	Black silt, soft, non-plastic	Black silt, loose fine sand, non-plastic	Vane Shear		<1
GB-00-08	-1.3	Black muck, silt, very soft	Black to very gray silt, fine sand, muck, very soft	Fine sandy silt, wood, soft, trace peat, micaceous brown to gray	ML / OL	<1
GB-00-09	-2.1	No recovery	Black muck and silt. Very high Sulphur odor, very soft and sticky. PID =2	Black to very dark gray organic silt, micaceous - does not stick to fingers when squeezed, strong Sulphur odor. PID=7	OL	<1

As seen in the upper core intervals (0-2 ft., 2-4 ft., and 4-6 ft.), the surface layers of the tidal flats on either side of the Causeway are generally characterized as very soft, black to very dark gray organic silt, often with some sand, shell and fiber content.

Standard Penetration Test (SPT) sampling was performed with blow counts recorded for each 6-inch interval. At the 5 samples of interest off the Causeway, the blow counts were all weight of rod ($N < 1$) in the upper core segments.

Vane shear testing (VST) was also performed on some of these samples in the field to characterize the shear strength of near surface sediments. For the off the Causeway samples, VST was undertaken at sample locations GB-00-05, GB-00-06, GB-00-07, at the 4-6 ft. interval. Based on VST results and analysis, the average undrained shear strength for the off the Causeway sediment was estimated to be 180 psf, while the saturated unit weight was estimated at 94 pcf, 0 - 10 ft. below mudline.

Based on the field sampling results and lab testing, strengths for the organic sediments were seen to increase with depth. Water contents are also reported to increase with depth. This is likely due to the increased organic contents observed with depth. (Harding, 2000)

As reported, the tidal flats sediment exhibits a high Sulphur odor. Photoionization detector (PID) testing was conducted on many samples, which registered readings as high as 31 ppm in GB-00-06, for example.

More recent field investigations and laboratory testing were initiated by AMEC FW in summer 2017 to yield a greater understanding of the physical properties of the contaminated sediment inventory in support of feasibility study development. Two sampling events, on August 22nd and October 19th, 2017 were undertaken.

For the August event, sampling was focused in four (4) discrete areas associated with some of the highest contaminant concentrations on the tidal flats. These areas were selected primarily for treatability testing and waste characterization analysis. From several of the coring locations, samples were collected to develop a treatability composite sediment sample. Of this master composite sample, 59.9% was silt and clay, with 38.4% sand, and 1.7% gravel, with a description of sandy silt (MH). LL was 72, PL was 43, and the PI was 29. Bulk (wet) density was 90.3 pcf and dry density was 50.1 pcf. Specific gravity was 2.61. Percent solids was 55.5%. (AMEC FW, 2018)

In the October event, ten (10) additional samples were collected from locations across the site. Samples were collected from borings advanced to the proposed depth of dredging (either 1, 2, 3, or 4 ft. below mudline) and composited across the depth of the recovered core. The October site-wide samples are more useful in assessing variability spatially and vertically across the site. A summary of the site-wide results is provided in Table 2.

For the ten (10) site-wide samples, silt content ranges from 17 to 66% and clay content ranges from 4 to 20%. Sand content ranges from 16.5 to 71.9% and descriptions include silt, silt with sand, sandy silt, and silty sand (MH, SM, and SM/ML). One sample was non-plastic. For plastic samples, LL ranged from 36 to 82, PL ranged from 33 to 41, and the PI ranged from 3 to 41. Bulk (wet) densities range from 81.5 to 112.5 pounds per cubic foot (pcf) and dry density ranges from 34.8 to 85.4 pcf. Specific gravity ranges from 2.5 to 2.68. Percent solids range from 50.4 to 75.9% and organic carbon ranges from 0.3 to 1.98%. (AMEC FW, 2018)

The results for the site-wide samples averaged 61.3% silt and clay, with 35.6% sand, and 0.9% gravel, with a description of sandy silt (MH). LL was 59.9, PL was 36.9, and the PI was 23. Bulk (wet) density was 101.1 pcf and dry density was 62.8 pcf. Specific gravity was 2.65. Percent solids was 61.6%. These results appear to provide a reasonable representation of overall geotechnical conditions at the site.

Table 2
 Summary of Geotechnical Laboratory Testing Data
 October 2017 Site-wide Samples

Sample Designation	Composite Depth Intervals (ft. bgs)	USCS Description	USCS Group Symbol	Moisture Content (%)	Total Unit Weight (pcf)	Dry Unit Weight (pcf)	% Solids	Specific Gravity	Particle Size Analysis				Atterberg Limits			
									% Gravel	% Sand	% Silt	% Clay	LL	PL	PI	LI

Data extracted from Preliminary Summary of Geotechnical Laboratory Testing Data (AMEC FW, 2018)
 pcf = pounds per cubic foot, LL = liquid limit; PL = plastic limit; PI = plasticity index; LI = liquidity index
 ASTM clay size particles are 0.005 mm or smaller and silt sized particles are 0.075 mm to 0.005 mm.
 Hydrometer results have not yet been provided by the laboratory.

Debris, shellfish, organic matter, marsh grasses, etc. should also be characterized and accounted for in dredge and processing system design. Based on initial visual assessment, debris potentially to be encountered consists of loose riprap near the toe of the revetment and jetty, marsh grasses located along the western and southeastern shorelines of the tidal flat, and bivalves and mollusks within the sediment matrix. Anthropogenic debris from SAEP operations is unlikely to be encountered according to site personnel familiar with historic operations, but possible. One isolated pile of riprap was observed at roughly the - 3.5 ft. MSL contour in the east tide flat just off the Causeway that may require removal.

2.4 Bathymetry

The bathymetry of the tidal flats remediation area ranges from approximately 0.0 ft. MSL near the toe of the rock revetment, to -10 ft. MSL just channelward of the Causeway. The slope is gently sloping to flat across most of the tidal flats, with an average depth of roughly -2.0 ft. MSL on the west flat, and -3.0 ft. MSL on the east flat. Three primary rivulets (on the west flat) and many smaller rivulets drain the marshes and tidal flats.

2.5 Water Levels

Tides at the site are semi-diurnal, that is with two nearly equal high tides and low tides every lunar day (roughly 24 hours and 50 minutes). Tidal datums applicable to the project site were obtained from NOAA Tide Station 8467150, Bridgeport, the closest harmonic station to the project site. The tidal datums, with elevations converted from the station datum (NAVD88) to MLLW and MSL (project vertical datum), are provided in Table 3. Historic extreme water levels are also provided in Table 3.

Table 3
Water Level Data based on NOAA Tide Station 8467150

Water Level Data: NOAA Station 8467150 Bridgeport, CT	Elevation (ft., NAVD88)	Elevation (ft., MLLW)	Elevation (ft., MSL)
Mean Higher High Water (MHHW)	9.30	7.32	3.70
Mean High Water (MHW)	8.97	6.99	3.37
Mean Tide Level (MTL)	5.59	3.61	-0.01
Mean Sea Level (MSL)	5.6	3.62	0.00
Mean Low Water (MLW)	2.22	0.24	-3.38
Mean Lower-Low Water (MLLW)	1.98	0.00	-3.62
North American Vertical Datum of 1988 (NAVD88)	0.00	-1.98	-5.60
Highest Observed Water Level (Oct. 30, 2012)	15.02	13.04	9.42
Lowest Observed Water Level (Feb. 2, 1976)	-2.60	-4.58	-8.20

2.6 Wave Climate

The lower Housatonic River estuary near its confluence with Long Island Sound is generally protected from long period swell. The longest fetch distance over which wind-waves incident to the SAEP tide flats can form is slightly over a mile. Vessel wakes from heavy boat traffic in the adjacent navigation channel can generate wave energy across the tidal flats as well. In either case, it is unlikely that wave heights exceed 1.5 ft. and wavelengths exceed 10 ft.

3.0 Dredging Alternatives Evaluation

Informed by the site visit, preliminary geotechnical characterization, and initial physical processes evaluation, a shortlist of dredging technologies are proposed and evaluated in this section.

3.1 Key Considerations

3.1.1 Dredgeability

With regards to the dredgeability of the tidal flats surface sediments, the following observations are made based on the initial characterization information and prior experience;

- The material is diggable using hydraulic or mechanical dredging technology,
- The material is transportable by both hydraulic slurry pipeline or barge,
- The presence of clay provides for possible impacts to hydraulic slurry transport and mechanical dewatering processes,
- The potential for resuspension and residuals generation is considerable,
- The material does not have adequate bearing capacity to support terrestrial excavation/hauling equipment with or without matting, *in situ* conditions,
- The sediments do not appear suitable for in-place dewatering and excavation “in the dry”.

3.1.2 Production

The shallowness and expansiveness of the tidal flats site will limit access, and the size and production capacity of the dredging equipment to be employed. The site’s tidal regime will greatly influence remedial design decisions and the dredge production rates and cleanup efficiency to be achieved during construction implementation.

Based on the existing bathymetry, 0.0 ft. MSL provides an approximate elevation at which shallow draft dredging plant will be able to begin productively working the tidal flats. A tides analysis was developed to provide an idea of the time available above 0.0 ft MSL. The analysis was run for a typical construction window of 0600 hrs. - 1800 hrs. The percentage of time and average available hours per day above specific tide elevations is summarized in Table 4.

Table 4
Floating Plant Working Tides Analysis (based on NOAA Station Bridgeport, CT)

Tide Elevation (ft., MSL)	Average Hours above / Day	% Time above / Day
4.0	0.2	2%
3.0	1.7	15%
2.0	3.4	29%
1.0	4.3	36%
0.0	4.9	41%

Based on the analysis, for approximately 5 hours per day tide elevations will provide adequate flotation for dredging with shallow draft equipment (<3 ft.). While much of the time these working high tides would be continuous within a 12-hr work day, oftentimes they are split between early morning and late afternoon, which would further impact production efficiency. During lower tides the dredging equipment could be productive in deeper areas along the northern slopes of the tidal flats.

3.1.3 Accuracy

Measured at approximately 58 acres, the tidal flats site would significantly benefit from the application of precision dredging equipment, to minimize the unnecessary removal, transportation and processing of clean underlying sediments. To underscore the importance of dredging accuracy, Table 5 was developed to provide a simple estimate of realistic overdredge performance values for the SAEP tidal flats site, and associated volume and cost implications. The estimate assumes a total unit cost of \$400/CY for dredging, processing and T&D, based on recent experience at other remedial dredging sites.

Table 5
Implications of Dredging Accuracy on Volume and Cost

SAEP Tide Flats Dredge Area (Acres)	SAEP Tide Flats Dredge Area (ft ²)	Overdredge (ft)	Overdredge Volume (ft ³)	Overdredge Volume (CY)	\$/CY	Cost
58	2,526,000	0.1	252,600	9,000	\$400	\$3,600,000
		0.2	505,200	19,000		\$7,600,000
		0.5	1,263,000	47,000		\$18,800,000
		1.0	2,526,000	94,000		\$37,600,000

As can be seen from these order of magnitude examples, there are significant cost and schedule implications driven by dredging accuracy performance. Accordingly, precision variants of both hydraulic and mechanical dredges are proposed for this project, as discussed below.

3.1.4 Resuspension and Residuals

To achieve cleanup goals cost effectively, dredging plant, support equipment and approaches should be applied to the SAEP site that minimize the generation of residual contamination. Both generated residuals and undredged inventory can lead to excessive, and expensive, returns to areas not meeting cleanup criteria. There can be many causes of generated residuals, including loss at the cutterhead / clamshell bucket, propwash, and sloughing. Undredged inventory is often a function of how accurately the contaminated inventory was sampled and delineated in the horizontal and vertical extent, modeled, and how effectively the dredge prism was designed.

Similarly, to meet project water quality requirements, and possibly allow for expanded construction windows, dredging plant, support equipment and approaches should be applied to the SAEP site that create minimal resuspension.

Table 6 was developed to summarize the resuspension and residuals generation ‘footprint’ of the proposed dredging alternatives, by operation.

3.1.5 Engineering Controls

It is appropriate to consider the need for engineering controls at this stage as they relate to the evaluation of dredging alternatives and project planning.

3.1.5.1 Cofferdam

A steel sheet pile cellular cofferdam extending from the shore connection of the jetty to the eastern boundary of east tidal flat could effectively isolate the tidal flats dredging areas from the Housatonic River during construction. Isolation of the dredging area by cofferdam allows for consideration of;

- Performing sediment removal in-the-dry, or
- Performing dredging with constant flotation, and
- Preventing water quality impacts outside the project.

As reported in the *Geotechnical Investigation Summary* (Harding, 2000), the water contents in the sediments increase with depth, which makes the prospect of in-place dewatering and excavation in-the-dry difficult. Possibly more feasible through construction of the cofferdam would be maintaining a constant water surface elevation over the dredge areas to provide adequate flotation at all times. This would allow for optimal dredging production, accuracy and residuals management by the floating dredge operation. Lastly, a cofferdam would allow for the isolation of the dredging project, and consequential water quality impacts during construction, from the Housatonic River estuary. This could open the possibility of dredging year-round and not being subject to environmental windows.

The potential advantages of the cofferdam described above are worth considering during the feasibility and remedial design stages and will need to be balanced against the cost of the installation and any impacts during and following construction. One other consideration would be the increase in flooding potential along adjacent shoreline properties caused by an ongoing high water surface elevation and storm-induced wind-waves. Accordingly, and based on detailed analysis of tidal flats shoreline topography, the cofferdam engineering control should not create a pool elevation exceeding a typical high tide elevation (i.e. MHW, or MHHW).

3.1.5.2 Wave Attenuator

To reduce potential impacts incident wind-waves and vessel wakes may have on dredging operations while underway in the tidal flats, a floating wave attenuator could be installed at strategic segments of the opening between the jetty and Causeway, and Causeway and eastern project shoreline. Again, the potential benefits in terms of production gains would need to be compared to the costs of installation and maintenance. It would also be important to consider that the larger, heavier dredge platforms would be less impacted by waves than the smaller plant.

3.1.5.3 Turbidity Curtain

The use of silt curtains and turbidity curtains to manage water quality impacts from dredging and support operations is common at contaminated sediment sites. For the SAEP tidal flats site it is anticipated that a Type II or Type III full length curtain could be required to contain plumes and manage

water quality and release to adjacent waters. The alignment and depth of the curtain will need to be determined to meet agency requirements and accommodate dredging operations. It's possible the curtain would need to enclose a large area, i.e. between the jetty and eastern project shoreline, and accommodate a large tidal flux. A solid understanding of the tidal regime, including velocities, is suggested.

3.2 Alternative Dredging Technologies

Informed by an initial understanding of site conditions, likely processing and disposal scenarios, and experience, a shortlist of five (5) dredging technologies are proposed as likely suitable alternatives to complete the SAEP dredging work;

- Hydraulic Swinging Ladder Cutterhead Dredge
- Precision (Mechanical) Excavator Dredge - Hydraulic Transport
- Precision (Mechanical) Excavator Dredge - Shallow Draft Barge Transport
- Amphibious Dredge (Mechanical / Hydraulic)
- Long Reach (Terrestrial) Excavator

Most of these dredging technologies have been demonstrated to be effective on other contaminated sediment sites and show potential for successful application on the conditions the SAEP tide flats site presents, to a degree they are evaluated here. Photos of each technology are provided in Appendix B.

3.2.1 Alternative 1 - Hydraulic Swinging Ladder Cutterhead Dredge

A hydraulic swinging ladder cutter suction dredge in the 8-in class is proposed as an appropriately sized and functioning shallow draft hydraulic pipeline dredge for the SAEP tidal flats.

The Dredge Supply Company (DSC) Moray SL and Ellicott 360 SL are versions of swinging ladder dredge, both 8-in discharge, with similar pumping characteristics, that are suitable for a shallow dredge cuts, pipeline conveyance over long distances, and feeding mechanical dewatering systems. The Moray has been used on more sediment remediation projects than the 360SL, in part likely due to customizations to their base model dredges for specific applications (i.e. shallow draft, precision cutting, and higher % solids). That said, the Ellicott 360 swinging ladder dredge has also been adapting to the needs of environmental dredging projects.

The swinging ladder dredge spuds down to stabilize the dredge platform while dredging, for improved accuracy, steadier state cutting and slurry concentrations, and consistent lane advance. Horizontal positioning is good, better than +/- 2 ft. typically, in using the walking spud system to advance in small increments (generally about one cutterhead width), before lowering the spuds again, to create a stable platform from which to swing the ladder and cutterhead. Both the Moray and 360SL can be operated in either swinging ladder mode, which swings that ladder and cutterhead into the bank whilst the barge is held stationary; or in conventional mode, where the entire dredge platform pivots off its stern spud. Conventional mode allows for wider swing widths, to about 40 ft., while swinging ladder provides closer to a 20 ft. swing width depending on pontoon configuration and ladder length and depth.

The dredges' cutterheads are designed to agitate and draw the targeted bank material closer to the influence of the suction intake immediately behind the cutter on the ladder. Options in cutterhead design, for improved accuracy, higher % solids, and reduced residuals, have been developed for the Moray dredge. Also, to orient the cutterhead and suction level with the cut bank to promote improved accuracy and higher solids, articulated ladders are available for both the Moray SL and 360 SL.

On a recent visit to the Lower Fox River project in Green Bay, Wisconsin the performance of swinging ladder dredge operations was observed. Three hydraulic dredges, including one (1) 12-in and two (2) 8-in swinging ladder dredges were being employed on the project to remove and transport PCB-contaminated sediment up to 10 miles to the project's sediment processing facility. System capacity is 6,500 GPM, with typical operating discharge of 5,000-6,000 GPM combined from the three dredges. The 8-in DSC Moray dredges, was producing on the order 25-30 cy/hr in high bank material, and as low as 5 cy/hr or less in thin face - cleanup pass mode. Corresponding slurry concentrations are reported to range from 8%-12% solids by weight for thick faces down to 2%-4% solids by weight for thin faces – cleanup passes. Dredging efficiencies (effective time) was reportedly maintained at 80% - 90%.

The Moray dredges can draw as little 1.5-2.0 ft and use both conventional and modified pontoons for shallow water operations. The contractor on the Fox River employs, and in some cases developed, several different cutter attachments, including the conventional rotating basket cutter for denser and thicker material, an environmental disk cutter, as well as a specialized straight vacuum for unconsolidated, high water content material removal overlying stiffer substrates. The Moray dredge is essentially self-propelled in lane advances through use of the kicker (traveling) spud. Project-averaged vertical dredging accuracies are reported to be 0.4-0.5 ft. using installed RTK-GPS and electronic dredge positioning system.

Conceptually, for the SAEP tidal flat project, one (1) or two (2) 8-in swinging ladder dredge systems, which are truckable, could be transported to the project site, and lifted or floated into the Housatonic or possibly mobilized off the Causeway. Depending on the required feed characteristics of the project dewatering system, and to optimize production, accuracy, and residuals management performance, it may be advisable to include automation controls (i.e. swing speed, cutter speed, flow rate) and a site-specific cutterhead design to minimize spillage and resuspension. The dredge would also be instrumented with RTK-GPS and dredge positioning and guidance system to implement a final, potentially tighter tolerance dredging plan. Shallower draft pontoons, articulated ladders, and advanced spud systems would also be considered as potential cost savings measures on a swinging ladder dredging alternative. Developing an operations plan that would leverage the swinging ladder's dredge pattern, to achieve cleanup with the greatest efficiency, would be done at the design phase.

3.2.2 Alternative 2 - Precision (Mechanical) Excavator Dredge - Shallow Draft Barge Transport

Based on prior experience with both hydraulic and mechanical dredge types, precision excavator dredges coupled with a latest generation level-cut sealed environmental clamshell bucket can offer the best available performance on contaminated sediment remediation sites in most key categories, including dredging accuracy, production, solids concentrations, and residuals management. These platforms are also versatile in their ability to easily convert to capping operations.

For shallower sites like the SAEP tide flats, the precision excavator dredges can be constructed on site by fabricating a barge platform, typically of modular barges (i.e. Flexifloat), lifting on deck plant (spud and winches/drums, genset, control rooms, etc.) with a shore-based crane, then rolling on the excavator.

The excavator is instrumented with RTK-DGPS and a dredge and bucket positioning system (DBPS), using a series of angle sensors (inclinometers) and rotation sensors mounted on the machine, boom, stick, and bucket for precise location and monitoring of the dredge and bucket. Operating from a relatively stable platform with 2-4 spuds, precision dredging, to better than 2-in. vertically, is achieved by placing the cutting edge of the bucket to target elevations monitored via a real-time heads-up display. For sites with high cost for T&D, use of the +/- 1-in. variance or better level-cut clamshell buckets is warranted to minimize further 'scallop' cuts into non-target sediments. Dredging progresses in defined set patterns, with consistent grab thicknesses and overlap to manage residuals and maintain planned production rates. For optimal solids concentrations and production rates, bucket grabs with consistently high fill efficiency are made. Barges provide the ability to transport dredge materials at highest possible solids concentrations, with the only water added that which is entrained in the bucket. To a large degree, clamshell buckets can also contend with debris better than hydraulic dredging systems.

Another potential advantage of mechanical dredging is the ability to leverage a 'visual' dredging approach. Developed on New Bedford Harbor during the Pre-Design Field Test in 2000, with the first excavator-mounted level-cut clamshell bucket used in the United States, this is the ability to make real time visual assessments of the material being dredged, to inform and tune core-based dredge target elevations. This approach is feasible where the contact between the contaminated inventory and 'clean' native material can be distinguished, either by color or consistency. Based on review of initial core logs from the east and west flat, the surface layers are predominantly homogenous black to dark gray organic silt (muck), very soft, with no distinguishing contact with native. The ability to apply the aforementioned approach in this case thus far appears limited.

For either the mechanical excavator with barge transport approach, or hybrid mechanical excavator – hydraulic transport approach, described in the next section, it is conceptualized that one (1) or two (2) shallow draft precision excavator dredges, would be employed to be able to work the tides efficiently, i.e. one working the east flat and one the west flat, or two working the west flat. These would use something like a CAT 3049MH long reach material handler or similar class excavator to operate an approximate 3.0 cy sealed level-cut environmental clamshell bucket. Deck barge platforms would be configured to provide greater flotation for optimal dredging production in the shallow conditions the tidal flats present. It is envisioned Flexifloat S-50 modular barges, which are 5 ft. high, would be used in the deck barge fabrication. Lane advances (stepping) and moves between areas would be accomplished using either an anchor and wire system or shallow draft push boat. These determinations would be based on balancing access, production, and residuals management on the tidal flats, while not sacrificing realized dredging accuracy.

To accommodate anticipated dredge production rates, depth limitations, and transport the mechanically dredge sediments from the point of dredging to shore, shallow draft barges would be needed for the mechanical dredging operations. Conceptually the barges would have capacities of roughly 60 cy, and not draw more than about 3 ft. To move the barges, shallow draft, truckable push boats would be employed. It is recognized that the push boats would be sources of resuspension, and their design and operations will need to be planned and managed carefully to keep water quality and residuals generation within acceptable ranges.

Another component that would need to be addressed with a mechanical dredging alternative (no hydraulic pipeline) at the SAEP, is transloading of dredged sediments to the presumed mechanical dewatering facility (i.e. east parking lot.). A likely scenario to transload dredged sediments under precision excavator and barge alternative would be to build a barge offloading area (BOA) on either the

northwest or northeast corner of the Causeway, or, near the channelside shore connection of the jetty. This would require construction of a pier-trestle capable of supporting a hydraulic offloader system and/or material offloading crane. Once installed, the BOA could be used for other site activities, including potentially residual cover and capping material conveyance to capping barges.

3.2.3 Alternative 3 - Precision (Mechanical) Excavator Dredge - Hydraulic Transport

This alternative combines the benefits of precision excavator dredging and hydraulic pipeline transport. Advantages and limitations are essentially the same as described for the precision excavator in the prior section. By the hybrid dredging approach, mechanical excavation removes material with a high degree of accuracy, typically better than 2-in below target elevation on average, at close to *in situ* concentrations, and places it in a hopper on board the dredge for initial screening of larger debris. Material that passes the debris screen, or grizzly, is slurried via a high efficiency, automated pump, with just enough makeup water to transport the material at maximum practical and steady-state concentrations. The makeup water can be sourced from a seachest along the dredge rail, or recirculated. The dredge material slurry would be received and processed in the same manner as hydraulically dredged sediment, at a presumed mechanical dewatering facility at the SAEP east parking lot.

During a pilot study in New Bedford Harbor in 2000, production averaged approximately 80 cy/hr, in deeper water, vertical dredging accuracy exceeded +/- 0.4 ft. with an average overdredge of -0.1 to -0.2 ft. below target elevation for the test area, and the visual dredging method was developed and applied to make real-time adjustments to the dredge plan. A similar system and approach has recently been setup at New Bedford and starting to achieve similar results, with improved accuracies. Additional details on the hybrid dredge system, can be reviewed in the Pre-Design Field Test study report, <https://www3.epa.gov/region1/superfund/sites/newbedford/23751.pdf>.

3.2.4 Alternative 4 - Amphibious Excavator

There are many variants of amphibious dredges, both mechanical and hydraulic. Mechanical models such as the Wilco marsh buggy are conventional excavator machines mounted on custom floating or low ground pressure (LGP) tracked pontoons. Hydraulic amphibious dredges such as the Amphibex or Waterking, use large sponsons and kicking spuds to traverse over ground. These platforms are also convertible to mechanical dredging mode.

While the production rates and accuracy of these dredges are not as high as Alternatives 1-3, the concept of employing amphibious dredges from floating to emergent conditions, to remain productive in the intertidal areas over the full tidal cycle, is attractive for this site. What would present a distinct disadvantage for these dredge types, however, is the problem of residuals generation and recontamination. Interaction of the tracks in the case of the marsh buggy and its support equipment (i.e. LGP trucks), or of the barge and sponsons in the case of the Amphibex type, would significantly disturb the bed surface, and cause mixing such that a 'clean' and organized removal sequencing would be difficult to achieve.

Examples of amphibious dredge types are provided in Figures 7 and 8 of Appendix B.

3.2.5 Alternative 5 - Long Reach (Terrestrial) Excavator

A long-reach excavator operated from stable ground close to the water's edge for the mechanical removal of near shore sediments is likely a suitable approach and cost effective for much of SAEP sediment site. Mechanically dredged material removed at close to *in situ* concentrations can provide savings in processing and disposal costs. Elimination of some of the shallowest areas, or areas where shoreline debris content may be high would also yield savings versus applying floating plant. Given the preliminary design slopes, a long reach excavator would also be a preferred technology for sediment removal and basin contouring in the Outfall 008 Drainage Ditch.

Long reach excavators are available from several manufacturers with various boom and stick configurations and aftermarket attachments. Reaches can extent to about 70 ft. from kingpin along the digging envelope. Smooth lipped, open faced buckets are typically used, however, with proper lifting capacity calculations, a sealed, level-cut clamshell bucket may be better applied, particularly if removing soft, high water content sediments, and on the tidal flats. An open bucket may be required in the Outfall 008 Drainage Ditch to accomplish slope sculpting. In either case, the dredged materials could be placed in dump trucks and presumably hauled to an onsite stabilization or processing facility.

Examples of long reach excavators working on shoreline and canal projects are provided in Figures 9 and 10 of Appendix B.

3.3 Summary

Specifications and estimated performance characteristics for the five alternative dredging technologies evaluated for this site are summarized in Table 6. Table 7 has been developed to provide the resuspension and residuals generation 'footprint' of each alternative, by operation. Table 7 does not yet attempt to quantify the various source mechanisms, nor propose mitigation measures or best management practices, of which there are many.

Based on the evaluations conducted, recommendation is made to retain Alternatives 1, 2, 3 and 5 for possible application on the SAEP project. To make a final determination on which technology or combination of technologies would be most effective in achieving project goals, detailed production and cost estimates for each system should be developed, cleanup goals better understood (i.e. backfilling to be carried out or not), and the site's dredged material disposal / beneficial use alternatives assessed further.

The estimates should incorporate reasonable performance value assumptions for production rates, dredging accuracy, equipment costs, added water, as well as construction schedules to assess the overall project cost for each dredging alternative. With this knowledge, determination of the most cost-effective dredging approach can be made, and developed during the remedial design phase.

CUTTER SUCTION DREDGE , SWINGING LADDER, HYDRAULIC TRANSPORT	Alternative 2 PRECISION MECHANICAL DREDGE - SHALLOW DRAFT BARGE TRANSPORT	Alternative 3 HYBRID - PRECISION MECHANICAL DREDGE / HYDRAULIC TRANSPORT	Alternative 4 AMPHIBIOUS DREDGE (MECHANICAL / HYDRAULIC)	Alternative 5 LONG REACH TERRESTRIAL EXCAVATOR
Anchor System	No anchor system required in swinging ladder mode. When dredging in conventional mode, to achieve wider cuts, an anchor and wire system is used to swing entire dredge. On SAEP a 3- or 4- wire system deployed up to 500 ft fore-aft and side-side of dredge, using shore connections when possible. Anchor setting and removal, with propwash and potential groundings of work boat and A-frame, and interaction of wires with bed, can cause resuspension and residuals.	No anchor system required for mechanical dredging operations, however may be used to optimize access and production in shallow tide dependent areas of the SAEP. Likely a 3- or 4-point wire system could make use of shore anchors when possible. Anchor setting and removal, with propwash and potential groundings of work boat and A-frame, and interaction of wires with bed, can cause resuspension and residuals.	Anchor and wire system may be advisable for hybrid dredge to optimize access and production in shallows tidal dependent areas of the SAEP, likely a 4- or 5-point wire system could make use of shore anchors when possible. Anchor setting and removal, with propwash and potential groundings of work boat and A-frame, and interaction of wires with bed, can cause resuspension and residuals.	Anchor and wire system not suitable for amphibious dredge types.	N/A, land-based
Point of Dredging	Overloading of pump suction results in plowing, loss, and generated residuals. Overpenetration and mixing generates residuals and disturbed inventory. Evacuation of sediment slurry in discharge pipeline back to harbor to clear pump of debris, backflushing, and clearing plugged pipelines generates resuspension and residual contamination. Potential for grounding.	Resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure through cycle to barge placement when bucket not sealed completely, or overfilled. Potential to cause generated residuals and undredged inventory if proper bucket overlap not achieved. Potential for grounding.	Resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure through cycle to barge placement when bucket not sealed completely, or overfilled. Potential to cause generated residuals and undredged inventory if proper bucket overlap not achieved. Potential for grounding.	Grounding and traversing over bed surface is inherent in these dredge types. Significant residuals and resuspension likely. In addition, overloading of pump suction results in plowing, loss, and generated residuals. Overpenetration and mixing generates residuals and disturbed inventory. Evacuation of sediment slurry in discharge pipeline back to harbor to clear pump of debris, backflushing, and clearing plugged pipelines generates resuspension and residual contamination. In mechanical mode resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure or open face bucket.	Resuspension with pressure wave as bucket approaches bed. Resuspension and residuals due to loss from grab closure or open face bucket.
Material Transport	Submerged and floating discharge pipeline interaction with bed surface. Periodic barge transits needed to transfer debris to shore.	Propwash and potential groundings from shallow draft barge operations. Barge transits from the dredges to the barge offloading area (BOA), oftentimes working the tides and with possibly less than 1 ft unkeel clearance.	Submerged and floating discharge pipeline interaction with bed surface. Periodic barge transits needed to transfer debris to shore.	By hydraulic method, submerged and floating discharge pipeline interaction with bed surface. Periodic barge transits needed to transfer debris to shore. By mechanical method LGP truck may be required, which would cause significant residuals. Propwash and potential groundings from shallow draft barge operations. Barge transits from the dredges to the barge offloading area (BOA).	N/A, land-based
Positioning and Lane Advance	Typically 1-2 passes required per 1 ft bank of material to remove. Uses traveling (kicker) spud to step forward in uniform increments, typically one cutterhead width. Each step requires resetting of the three (3) 8-in square spuds.	Typically 1 pass required per 1-2 ft bank of material to remove. Uses two (2) 20-in spuds to position dredge. Lane advance can be achieved by traveling spud, push boat assist, or anchor/wire, each with potential to generate resuspension and residual generation potential.	Typically 1 pass required per 1-2 ft bank of material to remove. Uses two (2) 20-in spuds to position dredge. Lane advance can be achieved by traveling spud, push boat assist, or anchor/wire, each with potential to generate resuspension and residual generation potential.	Typically 1 pass required per 1-2 ft bank of material to remove. Uses two (2) 8-10 in. spuds to position. Lane advance can be achieved by traveling spud, outboards, push boat assist, or tracking over bed surface, each generate resuspension and residuals.	N/A, land-based
Move between Areas	Moving dredges between areas upon completing an area, to accommodate bathy surveys and verification sampling, or working the tides. Propeller wash from work boats and pipeline moves creates resuspension and potentially residuals.	Moving dredges between areas upon completing an area, to accommodate bathy surveys and verification sampling, or working the tides. Propeller wash from work boats create resuspension and potentially residuals.	Moving dredges between areas upon completing an area, to accommodate bathy surveys and verification sampling, or working the tides. Propeller wash from work boats and pipeline moves creates resuspension and potentially residuals.	Movements achieved by traveling spud, outboards, push boat assist, or tracking over bed surface, each generate resuspension and residuals.	N/A, land-based
Debris Management	Separate debris removal operation may be required, but not foreseen on SAEP.	Separate debris removal step not anticipated.	Separate debris removal step not anticipated.	Separate debris removal step not anticipated.	Separate debris removal step not anticipated.

ALTERNATIVE 4 - MECHANICAL DREDGE WITH HYDRAULIC TRANSPORT, BELT FILTER PRESS AND ON-SITE BENEFICIAL REUSE

Description	Units of Meas.	Quantity	Unit Price (Includes Taxes, OH, Profit)	Total Cost
Work Plans and Submittals (Assumed 1% of Total Labor)	LS	1	\$ 108,257	\$ 110,000
Mobilization (Assumed 10% of Total Equipment)	LS	1	\$ 2,564,219	\$ 2,570,000
Temporary Construction (North Processing Area)	LS	1	\$ 1,431,632	\$ 1,440,000
Temporary Construction (South Processing Area)	LS	1	\$ 2,400,704	\$ 2,410,000
Conditions Surveys	LS	1	\$ 2,313	\$ 3,000
Topographic Surveys	LS	1	\$ 49,961	\$ 50,000
Hydrographic Surveys	LS	1	\$ 176,122	\$ 180,000
Utilities Surveys	LS	1	\$ 75,468	\$ 76,000
Debris Surveys	LS	1	\$ 52,954	\$ 53,000
Environmental Protection	LS	1	\$ 479,272	\$ 480,000
Environmental Monitoring	LS	1	\$ 368,354	\$ 370,000
Debris Removal	CY	3,487	\$ 61	\$ 220,000
Dredging - Mechanical - Hybrid	CY	155,573	\$ 57	\$ 8,850,000
Offloading - Hydraulic - Hybrid	CY	155,573	\$ 17	\$ 2,630,000
Processing - Hybrid - Geotube	CY	155,573	\$ 31	\$ 4,890,000
Backfill Material Procurement and Delivery - Mechanical	CY	111,062	\$ 40	\$ 4,500,000
Backfill Material Loading - Mechanical - Telebelt	CY	111,062	\$ 16	\$ 1,730,000
Backfill Material Placement - Hybrid	CY	111,062	\$ 48	\$ 5,310,000
Characterize and Handle for Onsite Disposal wo/PC - Mechanical (Alt 4)	Ton	195,966	\$ 3	\$ 640,000
Characterize, Transport, and Dispose TSCA (>=50 PPM) wo/PC - Mechanical (Alt 4)	Ton	1,284	\$ 225	\$ 290,000
Characterize, Transport, and Dispose RCRA wo/PC - Mechanical (Alt 4)	Ton	12,774	\$ 142	\$ 1,820,000
Water Treatment - Hydraulic Transport	LS	1	\$ 2,697,116	\$ 2,700,000
Site Restoration	LS	1	\$ 1,078,452	\$ 1,080,000
Demobilization (Assumed 10% of Total Equipment)	LS	1	\$ 2,564,219	\$ 2,570,000
TOTAL				\$ 44,970,000

<p>Amec Foster Wheeler, Inc. 271 Mill Road Chelmsford, MA 01942</p>	<p>Project: Stratford Army Engine Plant Date: 10/26/2018 Calc. By: JR Checked By: TD</p> 
---	--

ALTERNATIVE 5 - MECHANICAL DREDGE WITH PTFM AND OFF-SITE DISPOSAL

Description	Units of Meas.	Quantity	Unit Price (Includes Taxes, OH, Profit)	Total Cost
Work Plans and Submittals (Assumed 1% of Total Labor)	LS	1	\$ 75,638	\$ 80,000
Mobilization (Assumed 10% of Total Equipment)	LS	1	\$ 2,527,270	\$ 2,530,000
Temporary Construction (South Processing Area)	LS	1	\$ 2,400,704	\$ 2,410,000
Conditions Surveys	LS	1	\$ 2,313	\$ 3,000
Topographic Surveys	LS	1	\$ 49,961	\$ 50,000
Hydrographic Surveys	LS	1	\$ 176,122	\$ 180,000
Utilities Surveys	LS	1	\$ 75,468	\$ 76,000
Debris Surveys	LS	1	\$ 52,954	\$ 53,000
Environmental Protection	LS	1	\$ 479,272	\$ 480,000
Environmental Monitoring	LS	1	\$ 368,354	\$ 370,000
Debris Removal	CY	3,487	\$ 61	\$ 220,000
Dredging - Mechanical	CY	155,573	\$ 60	\$ 9,300,000
Offloading and Processing - Mechanical/PFTM	CY	155,573	\$ 84	\$ 13,030,000
Backfill Material Procurement and Delivery - Mechanical	CY	111,062	\$ 40	\$ 4,500,000
Backfill Material Loading - Mechanical - Telebelt	CY	111,062	\$ 16	\$ 1,730,000
Backfill Material Placement - Mechanical	CY	111,062	\$ 48	\$ 5,310,000
Characterize and Handle for Onsite Disposal w/PC	Ton	207,724	\$ 3	\$ 680,000
Characterize and Barge Transport for Offsite TSCA (>=50 PPM) Disposal	Ton	1,284	\$ 285	\$ 370,000
Characterize and Barge Transport for Offsite RCRA (>=1 to <50 PPM) Disposal	Ton	12,774	\$ 148	\$ 1,890,000
Water Treatment - Mechanically Dredged	LS	1	\$ 428,408	\$ 430,000
Site Restoration	LS	1	\$ 1,078,452	\$ 1,080,000
Demobilization (Assumed 10% of Total Equipment)	LS	1	\$ 2,527,270	\$ 2,530,000
TOTAL				\$ 47,300,000

<p>Amec Foster Wheeler, Inc. 271 Mill Road Chelmsford, MA 01942</p>	<p>Project: Stratford Army Engine Plant Date: 10/26/2018 Calc. By: JR Checked By: TD</p> 
---	--

ALTERNATIVE 6 - MECHANICAL DREDGE WITH OFF-SITE PROCESSING AND DISPOSAL

Description	Units of Meas.	Quantity	Unit Price (Includes Taxes, OH, Profit)	Total Cost
Work Plans and Submittals (Assumed 1% of Total Labor)	LS	1	\$ 75,288	\$ 80,000
Mobilization (Assumed 10% of Total Equipment)	LS	1	\$ 2,520,456	\$ 2,530,000
Temporary Construction (North Processing Area)	LS	1	\$ 1,431,632	\$ 1,440,000
Conditions Surveys	LS	1	\$ 2,313	\$ 3,000
Topographic Surveys	LS	1	\$ 49,961	\$ 50,000
Hydrographic Surveys	LS	1	\$ 176,122	\$ 180,000
Utilities Surveys	LS	1	\$ 75,468	\$ 76,000
Debris Surveys	LS	1	\$ 52,954	\$ 53,000
Environmental Protection	LS	1	\$ 479,272	\$ 480,000
Environmental Monitoring	LS	1	\$ 368,354	\$ 370,000
Debris Removal	CY	3,487	\$ 61	\$ 220,000
Dredging - Mechanical	CY	155,573	\$ 60	\$ 9,300,000
Backfill Material Procurement and Delivery - Mechanical	CY	111,062	\$ 40	\$ 4,500,000
Backfill Material Loading - Mechanical - Telebelt	CY	111,062	\$ 16	\$ 1,730,000
Backfill Material Placement - Mechanical	CY	111,062	\$ 48	\$ 5,310,000
Characterize and Barge Transport for Offsite Non-TSCA (<1 PPM) Disposal	Ton	195,966	\$ 156	\$ 30,480,000
Characterize and Barge Transport for Offsite TSCA (>=50 PPM) Disposal	Ton	1,284	\$ 285	\$ 370,000
Characterize and Barge Transport for Offsite RCRA (>=1 to <50 PPM) Disposal	Ton	12,774	\$ 148	\$ 1,890,000
Water Treatment - Mechanically Dredged	LS	1	\$ 428,408	\$ 430,000
Site Restoration	LS	1	\$ 1,078,452	\$ 1,080,000
Demobilization (Assumed 10% of Total Equipment)	LS	1	\$ 2,520,456	\$ 2,530,000
TOTALS				\$ 63,100,000

<p>Amec Foster Wheeler, Inc. 271 Mill Road Chelmsford, MA 01942</p>	<p>Project: Stratford Army Engine Plant Date: 10/26/2018 Calc. By: JR Checked By: TD</p>

OUTFALL-008 - Excavation, Solidification and Off-Site disposal

Description	Units of Meas.	Quantity	Unit Price	Total Cost
Work Plans and Submittals (Assumed 2% of Total Labor)	LS	1	\$ 6,879	\$ 7,000
Mobilization (Assumed 10% of Total Equipment)	LS	1	\$ 35,374	\$ 36,000
Temporary Construction	LS	1	\$ 154,092	\$ 160,000
Surveys	LS	1	\$ 48,608	\$ 49,000
Debris Removal	CY	245	\$ 63	\$ 16,000
Sheet Pile Installation for Water Diversion	LS	33,000	\$ 60	\$ 1,980,000
Excavation	CY	6,370	\$ 68	\$ 440,000
Processing	CY	6,125	\$ 56	\$ 350,000
Backfill Material Procurement and Delivery	Ton	7,802	\$ 24	\$ 190,000
Backfill	CY	5,779	\$ 66	\$ 390,000
Characterize and Transport for Non-TSCA (< 1PPM) Disposal	Ton	7,173	\$ 142	\$ 1,020,000
Characterize and Transport for RCRA (>=1 to <50 PPM) Disposal	Ton	2,088	\$ 142	\$ 300,000
Water Treatment - Mechanically Dredged	LS	1	\$ 428,408	\$ 430,000
Site Restoration	LS	1	\$ 318,292	\$ 320,000
Demobilization (Assumed 10% of Total Equipment)	LS	1	\$ 35,374	\$ 36,000
TOTALS				\$ 5,720,000

<p>Amec Foster Wheeler, Inc. 271 Mill Road Chelmsford, MA 01942</p>	<p>Project: Stratford Army Engine Plant Date: 10/26/2018 Calc. By: JR Checked By: TD</p>

OUTFALL-008 - Excavation, Solidification and On-Site Beneficial Reuse

Description	Units of Meas.	Quantity	Unit Price (Includes Taxes, OH, Profit)	Total Cost
Work Plans and Submittals (Assumed 2% of Total Labor)	LS	1	\$ 8,611	\$ 9,000
Mobilization (Assumed 10% of Total Equipment)	LS	1	\$ 42,972	\$ 43,000
Temporary Construction	LS	1	\$ 154,092	\$ 160,000
Surveys	LS	1	\$ 48,608	\$ 49,000
Debris Removal	CY	245	\$ 63	\$ 16,000
Sheet Pile Installation for Water Diversion	LS	33,000	\$ 60	\$ 1,980,000
Excavation	CY	6,370	\$ 68	\$ 440,000
Processing	CY	6,125	\$ 56	\$ 350,000
Backfill Material Procurement and Delivery	Ton	7,802	\$ 24	\$ 190,000
Backfill	CY	5,779	\$ 66	\$ 390,000
Characterize and Handle for Onsite Disposal	Ton	7,173	\$ 47	\$ 340,000
Characterize and Transport for RCRA (>=1 to <50 PPM) Disposal	Ton	2,088	\$ 142	\$ 300,000
Water Treatment - Mechanically Dredged	LS	1	\$ 428,408	\$ 430,000
Site Restoration	LS	1	\$ 318,292	\$ 320,000
Demobilization (Assumed 10% of Total Equipment)	LS	1	\$ 42,972	\$ 43,000
TOTALS				\$ 5,020,000
